It includes the forms known as *rust*, *smut*, *mildew*, etc. The order is remarkable for the peculiar alternation of forms undergone by many of the species, which are known as the acidium form, urediform, and teleutiform, and which were long considered as independent genera. *Puccinia graminis*, the so-called corn-mildew, may be taken as the type of the course of development followed by most *Uredineæ*, the three form-genera *Æcidium*, *Uredo*, and *Puccinia* being different stages of it. The first or acidium stage is the cluster-cup of the barberry; the second or urediform is the red-rust of grain; and the third or *Puccinia* is the mature form. See *Fungi, Puccinia, rust*, 3, *mildew, Micro-puccinia, Contomyces, heterocism*.—**Tremelloid Uredineæ**, a group of *Uredineæ* which do not possess a sporocarp generation, but consist of a teleutospore-bearing generation with usually softer and more gelatinous membranes.

Urena (ü-ré-nä), *n.* [NL. (Dillenius, 1732), < *uren*, its name in Malabar.] A genus of plants, of the order *Malvaceæ*, type of the tribe *Ureneæ*. It is characterized by flowers with five connate bractlets, and fruit everywhere roughened by minute hooks. They are herbs or shrubs, with usually angled or lobed leaves, and small yellowish flowers, commonly in sessile clusters. They are employed medicinally for their mucilaginous properties in India and elsewhere. In Brazil the flowers of *U. lobata* furnish an expectorant, and the roots and stems a decoction used for colic. *U. lobata* and *U. sinuata*, both common throughout the tropics, yield from their inner bark a useful fiber; that of the former, the *guazima* of Brazil, makes a strong cordage and a good paper. At Pensang the scentless leaves of *U. lobata*—there an abundant weed, known as *perpulut*—are collected, dried, and sold for mixing with patchouli, which they resemble.

They are shrubs or small trees. A few are climbers, as *U. elata* of Jamaica, which is said to reach a height of 30 feet. They constitute, together with species of *Pilea*, the plants known as *nettle* in the West Indies, replacing there the genus *Urtica*. *U. glabra* (*U. Sandwicensis*), the opuhe of the Hawaiians, a small tree free from stinging hairs, yields a valuable fiber highly esteemed there for making fishings-nets. Several other species furnish fiber for ropes, as *U. baccifera*, a small prickly tree frequent from Cuba to Brazil, used medicinally in the West Indies as an aperient. *U. tenax*, a recently described South African species, yields a fiber resembling ramie.

See cut under *kidney*. In man the ureter is a very slender tube, from 15 to 18 inches long, running from the pelvis of the kidney to the base of the bladder, at the posterior angle of the trigonum. It rests chiefly upon the psoas muscle, behind the peritoneum. Its structure includes a fibrous coat, longitudinal and circular muscular fibers, and a lining of mucous membrane, with vessels and nerves from various sources. The ureter pierces the wall of the bladder very obliquely, running for nearly an inch between the muscular and mucous coats of that viscus.

[= F. *urèthre* = Sp. *uretra* = Pg. *urethra* = It. *uretra*, < L. *urethra*, < Gr. *oûρηθρα*, the passage for urine, < *oûpiv*, urinate, < *oûpov*, urine: see *urine*.] A modification of a part of a urogenital sinus into a tube or a groove for the discharge of the secretion of the genital or urinary organs, or both; in most mammals, including man, a complete tube from the bladder to the exterior, conveying urine and semen in the male sex, urine only in the female; in some birds, a penial groove for the conveyance of semen only. The urethra of the male is always a part of the penis, or a penial urethra, continuous usually with the urethral part of the urogenital sinus; that of the female is only exceptionally a part of the clitoris. In man the urethra extends from the neck of the bladder to the end of the penis, usually a distance of 8 or 9 inches. It is divided into three sections. The *prostatic* is that first section of the urethra which is embraced by the prostatic gland, 1½ inches long, somewhat fusiform; upon its floor is a longitudinal ridge, the *verru montanum* or *caput gallinaginis*, on each side of which is a depression, the *prostatic sinus*, perforated by openings of the prostatic ducts. In advance of the veru is a median depression or cul-de-sac, variously known as the *vesicula prostatica*, *vagina masculina*, *sinus peculiaris*, *uterus masculinus*, etc.; and the orifices of the ejaculatory ducts of the seminal vesicles open here. The *membranous* is that second section of the urethra, about ¾ inch long, which extends from the prostatic gland to the corpus spongiosum; it is contracted in caliber, perforates the deep perineal fascia, and is embraced by layers reflected from this fascia and by the specialized compressor urethra muscle. The *spongy* section of the urethra extends from the membranous section to the end of the penis, being all that part of the urethra which is embraced by the penial corpus spongiosum. It is dilated at its beginning—this dilatation being sometimes specified as the *bulbous* section of the urethra, and further marked by the opening of the ducts of Cowper's glands—and at its end, within the glans penis, this terminal enlargement being the *jossa navicularis*. The urethra ends in a narrow vertical slit, the *meatus urinarius*. Numerous submucous follicles, the *glands of Littre*, open into the spongy section of the urethra; one of these openings forms a recess of considerable size, the *lacuna magna*. The substance of the urethra includes mucous, muscular, and erectile tissue. In the female the urethra is very short, about 1½ inches in length, and much more simple in structure and relations than that of the male.—**Bulb of the urethra**. See *bulb*.—**Bulbous urethra**, that part of the extent of the urethra which corresponds to its bulb. See *bulb*.—**Crista urethræ**. uric (ū'rik), *a.* [= F. urique = Sp. Pg. urico, *< NL. *uricus, < Gr. οὐρον, urine: see urinc.*] Of, pertaining to, or obtained from urine.—

Uric acid, an acid, C₅N₄H₄O₃, characteristic of urine. It crystallizes in scales of various shapes of a brilliant white color and silky luster when pure, but in the urine the crystals are of a reddish-yellow color. It is inodorous and insipid, heavier than water, nearly insoluble in it when cold, and only to a slight extent dissolved by it when hot. The solution reddens litmus-paper, but feebly. When it is dissolved in nitric acid, and the solution is evaporated and treated with ammonia, a fine purple color is produced; by this reaction uric acid may be detected. It occurs in small quantity in the healthy urine of man and quadrupeds, but is the chief constituent in the urine of birds and reptiles; hence it is often found abundantly in Peruvian guano. It is normally present in small amount in the blood as urate, and it constitutes the principal proportion of some urinary calculi and of the concretions causing the complaint known as the gravel. Sometimes called *lithic acid*.

The name is from the Roman station *Uriconium*, the site of the present village of Wroxeter, in Shropshire.

The true nature of the urim and thummim (literally 'lights and perfections') is not known. They seem to have been small objects kept inside the so-called "breastplate," which was folded double, and many authorities believe them to have been precious stones or figures, used as lots or otherwise. There is no indication of their use after the time of David, and after the captivity they are alluded to as lost.

There is a rival figure for the same constellation—a wagon. (See *wain*.) Both figures are mentioned by Homer. The name of the bear is translated from some original Aryan language, since the constellation in Sanskrit is called *riksha*—a word which means in different genders a 'bear' and a 'star.' As the seven stars of the Great Bear are in many languages

The Constellations Ursa Major, Ursa Minor, and Draco.

called the Septentrions, it is probable the figure of the bear, which by its tail would seem to have originated among some people not familiar with bears, may have been the result of a confusion of sound. Draco appears to have had formerly a longer tail, twisting down in front of Ursa Major.—**Ursa Minor**, a constellation near the north pole, the figure of which imitates that of Ursa Major, which its configuration resembles. It also has a rival figure of a wagon, and is sometimes called the Cynosure, which seems to mean 'dog's tail.' At the time of the formation of these constellations the pole must have been near a Draconis; and during the greater part of history sailors have steered by Ursa Minor as a whole. See cut above.

Ursidæ (ēr'si-dē), *n. pl.* [NL., < *Ursus* + *-idæ*.] A family of plantigrade carnivorous mammals, the bears, outwardly characterized by large size, heavy, stout, and clumsy form, a pig-like snout, rudimentary tail, and shaggy hair. The family belongs to the order *Feræ*, suborder *Fissipedia*, and is the type of the arctoid series of the latter. (See *Arctoidæ*.) The bears are less exclusively carnivorous than most other representatives of the order, being frugivorous as well, and almost omnivorous; the dentition is correspondingly modified, the grinders being more or less tubercular, not sectorial. There are two true molars on each side of the upper jaw, and three on each side of the lower jaw, all tubercular, as is the last upper premolar; there are also special cranial characters. The family was formerly of greater extent, including the racoon, badger, glutton, and other plantigrade *Carnivora*; it is now limited to the genus *Ursus* and its immediate relatives, or the bears proper, inhabiting chiefly the northern hemisphere. There are about 6 genera, of which *Melursus* or *Prochilus* is the most distinct from *Ursus* proper. See *Ursus* and *bear* (with cuts), and cuts under *aswail*, *bruang*, *Plantigrada*, *scaphotunar*, and *spectacled*.

blotches, and hence is called *red-spotted purple*. Its larva feeds on many plants, as willow, oak, blackberry, cherry, and species of *Faccinum*.

Ursuline (ēr'sū-lin), *a. and n.* [*NL. Ursulinus*, < LL. *Ursula* (see def.), a woman's name, < L. **ursula*, dim. of *ursa*, a she-bear: see *Ursa*.] 1. *a.* Of or pertaining to the Roman Catholic order or company of Ursulines.

Ursine, *n.* One of an order or company of Roman Catholic women founded by St. Angela Merici at Brescia in 1537, for the nursing of the sick and the teaching of young girls. The Ursulines took their name from St. Ursula, whose protection they invoked. At first they neither took regular vows nor adopted conventual rules, but in 1612 they were divided into the *congregated Ursulines*, who still adhere to the original organization, and the *religious Ursulines*, who take solemn vows, observe enclosure, and follow the rule of St. Augustine. The order was introduced into Canada in 1639, and into the present territory of the United States in 1727.

Ursus (ēr'sus), *n.* [NL., < L. *ursus* = Gr. *ἄρκτος* = Ir. *art* = Skt. *riksha*, a bear.] A genus of plantigrade carnivorous mammals, the bears, of the family *Ursidæ*. It was formerly coextensive with the family, and was even applied to some animals not

now included in *Ursidæ*. It is now restricted to such species as the brown bear of Europe, *U. arctos*, and the grizzly and black bears of North America, *U. horribilis* and

American Black Bear (*Ursus americanus*).

U. americanus; for the polar bear, spectacled bear, sun-bear, and honey-bear (or sloth-bear) have been detached under the names of *Thalassarctos*, *Fremarectos*, *Helarectos*, and *Melursus* (or *Prochilus*) respectively. See *bear* (with cuts), and cuts under *scaphotunar* and *Plantigrada*.

Urtica (ēr'ti-kä), *n.* [NL. (Malpighi, 1675; Brunfels, 1530), < L. *urtica*, a nettle, so called from the stinging hairs, < *urere*, burn: see *ustion*.] A genus of apetalous plants, the nettles, type of the order *Urticeæ* and tribe *Urticeæ*. It is characterized by opposite leaves furnished with stinging hairs and free or united stipules; by the fruit, a straight achene; and by its unisexual flowers, the pistillate with four unequal segments. There are about 30 species, widely scattered over most temperate and subtemperate regions. They are annuals or perennials, in a few species woody at the base. They bear petioled toothed or lobed leaves, usually with from five to seven nerves. The small and inconspicuous greenish twin flowers are borne in small clusters or panicles. For the species in general, see *nettle*; for *U. ferox*, see *onga-onga*. Nearly 400 former species are now classed elsewhere, especially under *Laportea*, *Urena*, *Pilea*, and *Boehmeria*. England has 3 species, 2 of which, *U. dioica* and *U. urens*, occur occasionally in the United States; 6 others are natives of the United States, 5 in the west and southwest, and 1, *U. gracilis*, a tall wand-like nettle of fence-rows and springy places, ranging eastward and northward from Colorado to the Atlantic.

Urticeæ (ēr-ti-kä'sē-ē), *n. pl.* [NL. (Dumortier, 1829), < *Urtica* + *-acæ*.] An order of apetalous plants, of the series *Unisexuales*, unlike all the other orders of the series, except the *Euphorbiacæ*, in the frequently herbaceous habit and in the presence of a distinct free perianth. It bears cymose staminate flowers, the perianth free from the accompanying bract, with one stamen opposite each lobe, or rarely fewer. The one-celled ovary contains a single ovule, the style at first terminal, but usually soon left at one side by the oblique growth of the indehiscent fruit, which is commonly a small achene or drupe, or by consolidation a syncarp. The order includes about 1,500 species, belonging to 110 genera, widely dispersed through warm and temperate regions, and classed in 8 tribes, of which the types are *Ulmus*, *Celtis*, *Cannabis*, *Morus*, *Artocarpus*, *Conocephalus*, *Urtica*, and *Thelygonum*. A great diversity in habit, fruit, and milky juice occasioned a former dismemberment of the order into the separate orders *Ulmaceæ*, *Celtidæ*, *Moracæ*, *Artocarpeæ*, *Urticeæ*, and *Cannabineæ*, respectively the elm, hackberry, mulberry, breadfruit, nettle, and hemp families, each coinciding nearly with the similar tribe now recognized. Among these tribes the *Urticeæ* and about 6 other genera are principally herbaceous; the others are trees or shrubs, sometimes, as in species of *Ficus* and *Ulmus*, reaching a great size. Their leaves are usually alternate, in outline entire, toothed, lobed, or palmately parted, and with deciduous stipules which often inclose the terminal bud. The inflorescence is primarily centripetal, but ultimately centrifugal, often in few-flowered clusters, sometimes forming a dense spike, raceme, or panicle, or with all the flowers closely massed on a fleshy receptacle. The order yields a number of edible fruits—as the fig, breadfruit, jackfruit, mulberry, and hackberry—in which the edible part may be either the ripened ovary, as the hackberry, or a fleshy calyx, as the mulberry, or the fleshy receptacle, as the fig, forming a syconium, or the thickened seed, as in species of *Artocarpus*. The order also includes several important dyewoods, as fustic; several ornamental as well as timber trees planted for shade or for hedges, as the elm, mulberry, and Osage orange; and many valuable fibers, as hemp and ramie. Species of some genera produce a narcotic resin, as hops and also hemp. (See *hashish*.) Several of the most notable trees belong here, as the banian, the bo-tree or sacred fig, the sycamore-fig, and the famed upas-tree of Java. (See *Ficus* and *Antiaris*.) In the tribes *Moracæ* and *Artocarpeæ*, and especially in the genus *Ficus*, an acrid emetic or poisonous milky juice abounds, either white or yellowish, in many furnishing india-rubber, in others becoming resinous, and yielding a gum. In a few, the cow-trees, it is innocuous, and is used as a beverage. See also *Pseudolmedia*, *Broussonetia*, *Streblus*, *Zelkova*, *Planera*, and *Humulus*.

urticeous (ēr-ti-kä'shius), *a.* In *bot.*, of or pertaining to the *Urticeæ*.

urticaria (ér-ti-ká'ri-á), *n.* [= *F. urticaire*, < NL. *urticaria*, nettle-rash, < L. *urtica*, a nettle; see *Urtica*.] Nettle-rash; uredo; hives. The disease is an eruption of wheals, occurring as an idiosyncrasy in some persons after eating shell-fish, certain fruits, or other food, and almost always dependent upon some gastric derangement. The wheals are indurated elevations of the skin, of varying size, whitish on the top (the swelling having forced the blood out of the capillaries of the skin), and surrounded by a reddened zone. They give rise to intense itching, especially when on the covered parts of the body. They appear suddenly and pass away with equal rapidity, one or more crops often coming and going in the course of a single day.

urticarial (ér-ti-ká'ri-al), *a.* [*< urticaire + -al*.] Pertaining to, of the nature of, or affected with urticaria. *Medical News*, LII. 546.

See *stinging caterpillar* (with cut), under *stinging*.

urtication (ér-ti-ká'shon), *n.* [= *F. urtication*; as *urticate + -ion*.] The action or result of urticating or stinging; a stinging or nettling operation or effect; specifically, the whipping of a benumbed or paralytic limb with nettles, in order to restore its feeling.

Urticææ (ér-tis'ô-ê), *n. pl.* [NL. (A. P. de Candelolle, 1805), < *Urtica + -ææ*.] A tribe of plants, of the order *Urticaceæ*, typified by the genus *Urtica*, the nettles. It is characterized by usually unisexual flowers with one to five anthers reversed in the bud. Inflexed filaments, an erect orthotropous ovule, and a straight embryo. It includes about 40 genera, classed in 5 subtribes, of which *Ureva*, *Proceris*, *Bahmeria*, *Parietaria*, and *Forskohlea* are the types. For other genera, see *Helzine*, *Pilea*, and *Laportea*. They are mostly herbaceous plants, numerous both in the tropics and in temperate regions, occasionally, as in *Ureva* and *Laportea*, becoming trees. They are remarkable, in the typical subtribe, the *Ureveæ*, for their stinging hairs, and more or less in all for the presence of abundant cystoliths or masses of crystals embedded in the tissues, and usually of a definite aspect, as radiating, fusiform, linear, etc., which is characteristic of each genus.

urubitinga (ô'rô-bi-ting'gá), *n.* [Braz., < *urubu*, a vulture, + Tupi *tinga*, white, bright, beautiful.] The native name of some hawk or other bird of prey of South America. It is adopted in ornithology (a) as the specific name of an alleged species of *Cathartes*, related to the turkey-buzzard of North America, and (b) [cap.] as the generic name of a number of black-and-white hawk of the buteonine division of the family *Falconidæ*. *U. zonura* of Brazil, etc., is the leading species; the anthracite hawk *U. anthracina*, ranges from Central America northward into the United States. The genus was named as such by Lesson in 1836.

urubu (ô'rô-bô), *n.* [Braz.] One of the American vultures; a bird of the genus *Cathartes* or *Catharista*. The name is commonly applied, in ornithology, to the black vulture, or zopilote, the tribe of Azara, *Catharista urubu* of Vieillot, *Vultur iota* or *Cathartes iota* of some writers, now usually known as *Cathartes atrata*. This resembles the common turkey-

buzzard of the United States, but differs in the mode of feathering of the neck, proportions of wings and tail, shape of bill, etc. It inhabits the warmer parts of America, from latitude 40° S. to nearly 40° N., and is common in the southern United States as far north as the Carolinas. It is very voracious, and acts as an efficient scavenger in the towns, where it becomes semi-domesticated. See also cut under *Cathartes*.

urucuri (ô'rô-kô'ri), *n.* A Brazilian palm, *Attalea excelsa*. Its large oily nuts are burned for their smoke in curing Para india-rubber. *Urucuri-iba* is the name of *Coccos coronata*.

II. n. An inhabitant of Uruguay.
urus (û'rus), *n.* [NL., < L. *urus* = Gr. *οἰσός*, wild ox, from the Teut. name represented by OHG. *ūr* = AS. *ūr* = Icel. *urr*, also in comp. OHG. *urohso*, etc.; see *ure*³ and *urochs*.] **1.** A kind of wild bull described by Cæsar; the mountain-bull, which ran wild in Gaul at the period of the Roman invasion, but has long been extinct. This is the *Bos urus*, or *B. primigenius*, of naturalists, and is also called *reem*, *tur*, *ur*, *ure*, and *ure-ox*. The *urus* had long spreading horns, unlike the European bison (*Bison bonasus*) or aurochs, and more like ordinary cattle, of which *B. primigenius* is a presumed ancestral form; but by some misunderstanding the name *urus* has also been attached to the aurochs, a few individuals of which still linger wild, but under protection, in the forests of Lithuania. It has been thought, erroneously, that the "Chillingham cattle," such as exist in confinement at Chillingham in Northumberland, England, and Hamilton in Lanarkshire, Scotland, are descendants of the animal described by Cæsar. See cut under *urochs*.

2. [cap.] A genus of *Boridæ*, including the aurochs and extinct bisons; therefore equivalent to *Bison* as now employed. *Bojanus*, 1827; *Owen*, 1843.—**3.** A kind of fossil ox from Eschscholtz Bay, Alaska. *Buckland*, 1831.

Ind. name.] **1.** The crab-eating ichneumon of India, *Herpestes urva*, of a black color, the hairs annulated with white, and with a white stripe on the side of the head.—**2.** [cap.] A generic name of such ichneumons, of which there are 3 Asiatic species, as *U. cancrivora*. *B. R. Hodgson*.

urvant (ér'vant), *a.* [Appar. an error for *curvant*.] In *her.*, same as *urvd*.

And all despised and fed the plant boy. *Crabbe*, *The Parish Register* (Works, l. 64).

4. Long-continued use or practice; customary way of acting; habitual use; custom; practice; as, the ancient *usage* of Parliament. Technically, in English law, *usage* has a different signification from *custom*, in not implying immemorial existence or general prevalence. In earlier times *custom* was defined as a law created or evidenced by immemorial usage. Some American writers use the terms as practically equivalent, except in regarding *usage* as the facts by which the existence of *custom* is proved; others treat *usage* as the habit of individuals or classes, such as those engaged in a particular trade or business, and *custom* as the habit of communities or localities.

Those who supported the *usages* were called *usagers*, and their opponents *non-usagers*. All the *usages* were enjoined in the nonjurors' communion office of 1718. The liturgical forms were authorized in the Scottish communion office of 1764, and the mixed chalice became an established custom. See *nonjurer*.—**Usages of war.** See *war*.—**Syn. 4. Habit, Manner**, etc. See *custom*.

8. In *liturgies*, the distinctive ritual and liturgical forms and observances, collectively and singly, of a particular church, diocese, group of dioceses, or community: as, Sarum use; Aberdeen use; Anglican use; Roman use. The term is most frequently applied to the varieties of ritual and liturgical usage in England before the Reformation and to monastic and Roman usage as differing from these, and also to the different local varieties of the ancient Gallican offices. In England the several uses were those of Sarum, York, Hereford, Bangor, Lincoln, etc. These had a common family likeness, and differed considerably from Roman use. The most important of them was Sarum or Salisbury use, which was the form of service compiled about 1085 from various diocesan uses, English and Norman, by St. Osmund, bishop of Salisbury and chancellor of England. The use of Sarum prevailed throughout the greater part of England, and in 1542 it was ordered to be observed throughout the whole province of Canterbury. The Book of Common Prayer, first issued in 1549, and founded mainly on Salisbury use, established a uniform liturgy for the whole Church of England, but, except by implication of certain rubrics, left the exact mode of ritual observance in many respects unprovided for. See *liturgy*, 3 (4). — Sarum use. See def. 8. — To have no use for. (a) To have no occasion or need for; be unable to convert to a profitable end; not to want. (b) To have no liking for. [U. S.]

use² (ūs), n. [ME. **ues*, **oes*, **oyss*, < OF. *ues*, **oes*, **ues*, **os*, **oeps*, **obs* = Pr. *obs* = OSP. *hueros* = It. *uopo*, profit, advantage, use, need, < L. *opus*, work, labor, need, AL. use, in legal sense; see *opus*. The word use² has been confused with use¹, with which it is now practically identical.]
In law, the benefit or profit (with power to direct disposal) of property — technically of lands and tenements — in the possession of another who simply holds them for the beneficiary; the equitable ownership of lands the legal title to which is in another. He to whose use or benefit the trust is intended enjoys the use of profits, and is called *cestui que use*. Since the Statute of Uses, the gift or grant of real property to the use of a person transfers to him directly the legal title; and the term *trust* is now commonly used to denote the kind of estate formerly signified by use, so far as the law now permits it to exist. (See *trust*, 5.)
Uses apply only to lands of inheritance; no use can subsist of leaseholds.

And use is a trust or confidence reposed in some other.
Sir E. Coke, Com. on Littleton, 272 b.

Use seems to be an older word than trust. Its first occurrence in statute law is in 7 Ric. II. c. 12, in the form *eps*. In Littleton "confidence" is the word employed. The Statute of Uses seems to regard use, trust, and confidence as synonymous. According to Bacon, it was its permanency that distinguished the use from the trust.
Encyc. Brit., XXIII. 560.

Pious uses, religious uses; more specifically, that class of religious uses which was not condemned by the law as superstitious. — Public use. See *public*. — Religious uses, uses or trusts for the propagation of religion, the support of religious institutions, or the performance of religious rites. — Resulting use. See *result*, v. i. — Secondary use. Same as *shifting use*. — Shifting use, a use or trust properly created for the benefit of one person, but so as to pass from him upon a specified contingency and vest wholly or in part in another. Thus, if A enfeoffed B to the use of C and his heirs, but if C should die or should inherit another estate in the lifetime of A, then to D and his heirs, the occurrence of the contingency would cause the use (and therefore, under the Statute of Uses, the legal title) to shift from C to D. — Springing use, the creation of an estate so as to arise (spring into effect) on a future event, after an estate enjoyed by the grantor, by means of a feoffment or conveyance under the Statute of Uses. — Statute of charitable uses. See *statute*. — Statute of Uses, an English statute of 1536 (27 Hen. VIII., c. 10) against uses and against devising lands by will (a practice which tended to defeat feudal dues), and intended to give the legal estate or absolute ownership to those who are entitled to the beneficial enjoyment of land. The principal clause enacted that thereafter whosoever should have

a use, confidence, or trust in any hereditaments should be deemed and adjudged in lawful seizin, estate, and possession of the same estate that he had in use—that is, that he, instead of the nominal grantee or trustee, should become the full legal owner. This principle has been adopted by provisions, known by the same title, in the legislation of most of the United States.—**Superstitious uses**, such religious uses as were condemned by English law at or after the Reformation as maintaining superstition, in which were included the providing of masses for the dead, etc. In the United States, generally, no restriction is placed upon uses for these purposes as such, all religious tenets not involving any contravention of the criminal law being on an equal footing; but trusts for such purposes are required to conform to the same rules as trusts for charitable or other secular uses, in respect to the existence of a competent corporate trustee and a defined or ascertainable object.—**Use and occupation**, the enjoyment of possession or the holding of real property belonging to another without a written lease, but under circumstances implying a liability to make compensation in the nature of rent.—**Use plaintiff**, a person beneficially interested in a claim, and for whose use or benefit an action is brought thereon in the name of another, as in the name of an apparent owner, or in the name of the state.

Conper, Retirement, i. 682.

=**Syn.** *Useless, Fruitless, Ineffectual, Unavailing, bootless, profitless, unprofitable, valueless, worthless, futile, abortive.* *Useless* often implies that the cause of failure lies in the situation: as, it is *useless* to try to mend that clock. *Useless* is the only one of these words that may thus be applied by anticipation to what might be attempted. That which is *fruitless, ineffectual, or unavailing* actually fails, and from hindrances external to itself. *Unavailing* is more likely to be used than *fruitless or ineffectual* where the failure is through some one's unwillingness: as, *unavailing* prayers or petitions, *ineffectual* efforts, *fruitless* labors. *Fruitless* is stronger and more final than *ineffectual or unavailing*.

Ustilagineæ (us'ti-lā-jin'ē-ē), *n. pl.* [NL., *< Ustilago (-gin-) + -æ.*] An extensive order of zygomycetous fungi, the smuts, parasitic in the tissues of living plants, especially flowering plants, causing much damage, particularly to the grasses. The mycelium is widely spreading, but soon vanishes. The teliospores are produced in the interior of mycelial branches, which often become gelatinized. The life-history begins with the production from the resting-spore of a promycelium which bears sporidic gametes. These gametes conjugate in pairs, and directly or by means of sporidia, produce a new mycelium, which in turn bears the resting-spores in another host. *Ustilago, Urocystis, and Tilletia* are the most important genera. See *Coniomyces, smut, 3, Frungi*.

It is nearly equivalent or correlative to the common-law prescription, but differs in that possession in good faith was required to constitute usucaption, but need not be in good faith to constitute prescription.

As the title here depends on possession, which is a mere fact, it is plainly reasonable that the law where the fact occurs should be applied in questions of usucaption or prescription, which is right growing out of a continued fact.

It is a section of an oviduct, originally a Mullerian duct, enlarged, thickened, united with its fellow of the opposite side, or otherwise modified, to serve as a resting-place for the ovum while this is developed to or toward maturity as an embryo or fetus, whence it is then discharged through a cloaca or a vagina. The *uterus* is single in most *Monodelphia*, and double in *Didelphia* and *Ornithodelphia*. When united,

but incompletely, it constitutes a *uterus bicornis*, or two-horned womb. In birds the name *uterus* is given to that terminal part of the oviduct where the egg is detained to receive its shell. The non-pregnant human uterus is a pear-shaped organ about 3 inches long, with a broad, flattened part above (the body), and a narrow, more cylindrical part below (the cervix). Within is a cavity which passes out into the Fallopian tube on each side above, and below opens into the vagina. The cavity narrows as it passes into the cervix at the internal os, and continues downward as the cervical canal, to terminate at the external os uteri or os tinnac. The uterus is supported by the broad ligament, a transverse fold of peritoneum which embraces it on each side, and by accessory ligaments, such as the round, vesico-uterine, and recto-uterine ligaments. It consists of a serous or peritoneal coat, a middle coat of smooth muscular fibers, forming most of its thickness, and an epithelial lining. See also cut under *peritoneum*.

Consisting in or pertaining to utility; having regard to utility rather than beauty and the like; specifically, making the greatest good of the greatest number the prime consideration. See the quotations.
It was in the winter of 1822-23 that I formed the plan of a little society, to be composed of young men agreeing in fundamental principles—acknowledging Utility as their standard in ethics and politics. . . . The fact would hardly be worth mentioning, but for the circumstance that the name I gave to the society I had planned was the *Utilitarian Society*. It was the first time that any one had taken the title of *utilitarian*, and the term made its way into the language from this humble source. I did not invent the word, but found it in one of Galt's novels, "The Annals of the Parish."
J. S. Mill.

The pursuit of such happiness is taught by the *utilitarian* philosophy, a phrase used by Bentham himself in 1802, and therefore not invented by Mr. J. S. Mill, as he supposed, in 1823.
Encyc. Brit., II. 576.

II. n. One who holds the doctrine of utilitarianism.

I told my people that I thought they had more sense than to accede from Christianity to become *Utilitarians*; for that it would be a confession of ignorance of the faith they deserted, seeing that it was the main duty inculcated by our religion to do all in morals and manners to which the newfangled doctrine of utility pretended.

Galt, Annals of the Parish (1821), xxxv.

utilitarianism (ü'til-i-tä'ri-an-izm), *n.* [*Utilitarian* + *-ism*.] The doctrine that the greatest happiness of the greatest number should be the sole aim of all public action, together with the hedonistic theory of ethics, upon which this doctrine rests. Utilitarianism originated with the marquis Cesare Bonesana Beccaria (1735-93), but its great master was Jeremy Bentham (1748-1832). He held that the sole possible rational motive is the expectation of pleasure, as measured by the intensity, propinquity, and duration of the pleasure, and the strength of the expectation. Utilitarian ethics, however, does not insist that such considerations need or ought to determine action in special cases, but only that the rules of morals should be founded upon them. These views greatly, and advantageously, influenced ethical thought and legislation in France, England, and the United States.

uti possidetis (ü'ti pos-i-dē'tis). [*L.*: *uti* = *ut*, as; *possidetis*, 2d pers. pl. pres. ind. of *possidere*, possess; see *possess*.] **1.** An interdict of the civil law by which a person who was in possession of an immovable was protected against any disturbance of his possession. It could also be used where there was a suit pending about the title, in order to determine with whom the possession should remain during the suit. Only the *possessor animo domini* was protected, except in a few cases where the protection of the interdict was extended to certain persons who had the mere physical possession. The question of good faith was as a rule unimportant, except if the possession had been acquired by force, or by stealth, or as a mere *precarium* from the defendant, the interdict could not be used against him, but the defendant could not object that the possession had been acquired in this way from a third person. This interdict and the corresponding one for movables were called *retinendæ possessionis* (for retaining possession), as they were granted (except in some cases, about which the commentators differ) only to persons who had not lost their possession, but had merely been disturbed in it.

Utricularia (ū-trik'ū-lā-ri-ā), *n.* [NL. (Linnaeus, 1737, < *L. utriculus*, a bag: see *utricule*.) A remarkable genus of plants, the bladderworts, the type of the order *Lentibulariaceae*, once known as *Lentibularia* (Rivinus, 1690). They are characterized by having a two-parted calyx with entire segments. The genus comprises about 160 species, or nearly the entire order, principally tropical, and American or Australian, some of them widely distributed over the world. Their characteristic habit is that of elongated floating rootless stems, clothed with close whorls of capillary and repeatedly forking green leaves, by some considered as branches, in most cases elegantly dissected and fringe-like. These become massed together at the apex into a small, bright-green roundish ball or winter-bud. The flowers are solitary or racemed, two-lipped, strongly personate and spurred, usually yellow, and borne on mostly naked scapes projecting from the water; they resemble otherwise those of the other personate orders, but have a globose free central placenta, like the *Primulaceae*. Most species produce great numbers of small, obliquely ovoid bladders, formed of a thin, delicate membrane, opening at the smaller end by a very elastic valvular lid, and covered within by projecting quadricord processes, serving as absorbent organs, and each composed of four divergent arms mounted on a short pedicel. The bladders serve, like various appendages in other insectivorous plants, for the absorption of soft animal matter, forming traps for minute water-insects, larvæ, entomostracans, and tardigrades. Other species are terrestrial, growing upon moist earth, and often bearing a rosette of linear or spatulate leaves, or sometimes covered with bladders, as the aquatic species. A few species are epiphytes, and produce bladders on multifold rhizomes, as in *U. montana* of tropical America. In this and several other species the plant also forms numerous tubers, which serve as reservoirs of water, and enable these, unlike all other species, to grow in dry

places. There are 14 species in the United States, of which *U. vulgaris* is the most widely distributed. *U. clandestina*, a common coast species, bears numerous globose whitish cistogenous flowers, besides the normal ones, which are broadly personate and yellow. Two species, chiefly of the Atlantic coast, *U. purpurea* and *U. renipinata*, are exceptional in their purple flowers. *U. nelumbifolia* of Brazil is singular in its growing only in water lodged in the dilated leaf-bases of a large *Tillandsia*, and propagating not only by seeds, but also by runners, which grow from one host plant to the next.

The rest apply to words. *Enunciate* expresses careful utterance, meaning that each sound or word is made completely audible: as, *enunciate* your words distinctly. *Pronounce* applies to units of speech: as, he cannot *pronounce* the letter "r"; he *pronounces* his words indistinctly; he *pronounced* an oration at the grave; he *pronounced* the sentence of death: the last two of these imply a solemn and formal utterance. *Deliver* refers to the whole speech, including not only utterance, but whatever there may be of help from skilful management of the voice, gesture, etc.: as, "a poor speech well *delivered* is generally more effective than a good speech badly *delivered*." *Deliver* still has, however, sometimes its old sense of simply uttering or making known in any way.

To inoculate with the cowpox, by means of vaccine matter or lymph taken directly or indirectly from the cow, for the purpose of procuring immunity from smallpox or of mitigating its attack.—2. In a general sense, to inoculate with the modified virus of any specific disease, in order to produce that disease in a mild form or to prevent its attack.

vaccination (vak-si-nä'shon), *n.* [= *F. vaccination = Sp. vacunación = Pg. vacinação = It. vaccinazione*; as *vaccinate + -ion*.] In *med.*, inoculation with vaccine, or the virus of cowpox, as a preventive of smallpox; in an extended sense, inoculation with the virus of any specific disease. The utility of vaccination with the virus of cowpox was discovered by Edward Jenner, an English surgeon, in the latter part of the eighteenth century, the first vaccination upon the human subject having been made in 1796. It consists in the introduction under the skin, or application to an abraded surface, usually on the upper arm or thigh, of a minute quantity of vaccine. This is followed, in a typical case, in about two days, by slight redness and swelling at the point of inoculation, and on the third or fourth day by the appearance of a vesicle filled with clear fluid, and umbilicated or depressed in the center. About the end of the eighth day a ring of inflammation, called the *areola*, begins to form around the base of the vesicle; it is usually hard, swollen, and painful. On the eleventh or twelfth day the inflammation begins to subside; the vesicle turns yellow, and then dries up and forms a crust or scab, which usually falls off about the end of the third week, leaving a permanent scar. The appearance of the areola is sometimes attended with rather severe constitutional disturbance, such as fever, headache, loss of appetite, swelling of the glands above the part, and a general feeling of malaise. The appearance of this eruption, more or less modified from rubbing of the clothes or from scratching, is the only certain evidence that vaccination has been successful, or has taken. See also *vaccine* and *vaccinia*.—**Auto-vaccination**, reinoculation of a person with virus taken from himself. This not infrequently occurs accidentally, the lymph from a ruptured vesicle being carried on the finger-nails and introduced at some other point.

vaccine (vak'sin), *a.* and *n.* [*< F. vaccin = Sp. vacuno = It. vacino, vaccine* (as a noun, *F. vaccine = Sp. vacuna = Pg. vaccina = It. vaccina*, *< NL. vaccinia*), *< L. vaccinus*, of a cow, *< vacca*, a cow; prob. akin to *Skt. vac, vāc*, cry, howl, low; cf. *voice*. Hence *vaccinate*, etc.] **I.** *a.* 1. Of or pertaining to cows; derived from cows; as, the *vaccine* disease, or cowpox.—2. Of or relating to vaccinia or vaccination.—**Vaccine agent**, in certain of the United States, a State officer whose duty it is to procure and distribute a supply of pure vaccine matter.—**Vaccine cicatrix**, the scar remaining after a successful vaccination. It is usually silvery-white, of an irregularly circular outline, slightly depressed below the level of the surrounding skin, and foveated, or having numerous shallow pits on its surface.—**Vaccine lymph, matter, virus**. Same as **II.**, 1.

II. *n.* 1. The virus of cowpox or vaccinia, used in the process of vaccination as a preventive of smallpox. Two varieties of vaccine are in use: namely, the *bovine*, that which is obtained directly from the heifer, and the *humanized*, or that which is obtained from vesicles on the human subject. The vaccinia following inoculation with bovine virus is usually attended with more pronounced local inflammation and constitutional symptoms than is that produced by the humanized lymph. Vaccine, as employed for vaccination, is prepared in the shape of dried lymph on quills or small flat pieces of bone or ivory, of fluid lymph in closed capillary glass tubes, and of crusts. Also called *vaccine lymph, matter, or virus*.

2. In a general sense, the modified virus of any specific disease introduced into the body by inoculation, with a view to prevent or mitigate a threatened attack of that disease or to confer immunity against subsequent attacks.

Also *vaccin*.

vaccine-farm (vak'sin-färm), *n.* A place where vaccine virus is cultivated by the systematic inoculation of heifers.

vaccinella (vak-si-nel'ä), *n.* Spurious vaccinia; an eruption which occasionally follows vaccination, but which is not true vaccineal eruption.

vaccine-point (vak'sin-point), *n.* A thin piece of bone or ivory, or a quill, sharpened at one end and coated with dried vaccine lymph. The inoculation may be made by abrading the skin with the sharp point, thus avoiding the use of a lancet.

vaccinia (vak-sin'i-ä), *n.* [*NL.*, *< L. vaccinus*, of or pertaining to a cow: see *vaccine*.] A specific eruptive disease occurring in cattle, especially in milk cows. It is characterized by an eruption, at first papular, then changing to vesicular, situated usually at the junction of the teats with the udder. The vesicle is umbilicated, the margin being more elevated than the center, and contains a clear yellowish fluid. The skin surrounding it is somewhat inflamed, reddish in color, and indurated. The vesicle increases in size up to about the tenth day, when the contents become more opaque, and a crust begins to form. This crust increases in size for a few days, and then dries up and falls off at about the end of the third week. During the height of the disease there may be a little fever and loss of appetite, and the yield of milk may be somewhat diminished; but in general the constitutional disturbance is slight. It is by inoculation with lymph taken from the vesicles in this disease as it occurs in the cow or in the human subject that immunity against smallpox is conferred upon man. See *vaccination* and *vaccine*. Also *vaccina* and *corpox*.

Vacciniaceæ (vak-sin-i-ä'sē-ē), *n. pl.* [*NL.* (Lindley, 1845), *< Vaccinium + -aceæ*.] An order of gamopetalous plants, of the cohort *Ericales*. It is distinguished from the related order *Ericaceæ* by the fact that the inferior ovary forms a fleshy fruit. It includes about 348 species, belonging to 27 genera (classed in two tribes, the *Thibaudiæ* and *Euvacciniæ*), natives of moist mountain woods in temperate and cold regions, also numerous in tropical Asia and America, with 3 genera in islands of the Pacific. They are erect or prostrate shrubs or trees, often epiphytes, sometimes with tuberous or thickened stems, and frequently climbing over trees. The leaves are alternate or scattered, generally evergreen, and the flowers are usually in bracted racemes. Four genera occur in the United States, of which *Vaccinium* (the type), *Gaylussacia*, and *Oxycoccus* are the most important, producing the blueberries, huckleberries, and cranberries of the market; the other genus, *Chiogenes*, the snowberry, is transitional to the *Ericaceæ*, or heath family. See cuts under *cranberry*, *huckleberry*, and *Vaccinium*.

Vaccinium (vak-siu'i-num), *n.* [*NL.* (Linneus, 1737), *< L. vaccinium*, blueberry, whortleberry.] A genus of gamopetalous plants, type of the order *Vacciniaceæ* and of the tribe *Euvacciniæ*; the blueberries. It is distinguished from *Gaylussacia*, the huckleberry genus, by the numerous ovules in each cell of the ovary and by sometimes having only eight stamens,

small, white, pink, or red, disposed in axillary or terminal racemes or axillary fascicles, rarely solitary, usually with bracts. Many of the species yield edible berries. (See *whortleberry* and *blueberry*, and compare *huckleberry*, *cranberry*, *hurtz*, and *hurtberry*.) The 3 well-known circum-polar species, *V. Myrtilus*, *V. uliginosum*, and *V. Vitis-Idæa*, are the only species in Europe, the most important being *V. Myrtilus*, the whortleberry. *V. uliginosum*, the blueberry or bog-bilberry, a smaller shrub with terete branches and usually four-parted flowers, is common in northern Britain and in Canada. *V. Vitis-Idæa*, the cowberry or mountain-cranberry, with evergreen leaves and prostrate stems, yields an acid red berry, edible when cooked, and sometimes substituted for the cranberry; it ranges to America from New England to Point Barrow, 71° 19' north. There are 10 or more species in Alaska, and 22 in the United States proper, classed in 4 distinct groups, of which the smaller are *Vitis-Idæa*, with ovate or globular corolla, and *Entodendron*, with open bell-shaped flowers, and berries little edible. (See *farkleberry* and *squaw-huckleberry*.) The blueberries, common species of the eastern United States and northward, forming the subgenus *Cyanococcus*, are replaced in the Rocky Mountains and Pacific States by the bilberries, species of *Vaccinium* proper, the typical section, which are themselves few and rare westward, but range more extensively in Canada. About 12 species occur in the northwestern United States, 3 of these and 10 others in the Southern States, 4 in the Rocky Mountain region, and 6 or more in Oregon or Nevada. Most species are low bushes; but *V. arboreum*, the farkleberry, sometimes reaches 25 feet in height, and *V. corymbosum*, the widely distributed blue huckleberry of the later summer market, is often 10 feet in height. The American cranberry, *Oxycoccus macrocarpus*, was formerly, and by some authors is still, referred to this genus.

(and F.) vacuité* = *Pr. vacuitat* = *Sp. vacuidad* = *Pg. vacuidade* = *It. vacuità*, < *L. vacuita* (-t-s), emptiness, < *vacuus*, empty; see *vacuous*.] 1. vacuole (vak'ū-ōl), *n.* [*F. vacuole*, < NL. **vacuolum*, dim. of *L. vacuus*, an empty space, vacuum; see *vacuum*.] 1. A minute cell or cavity in the tissue of organisms.—2. In *anat.*, a minute space, vacuity, or interstice of tissue in which lymphatic vessels are supposed to originate.—3. In *zool.*, any minute vesicle or vacuity in the tissue of a protozoan, as an amoeba. Vacuoles are sometimes divided into *permanent*, *contractile* or *pulsating*, and *gastric*. The first are sometimes so numerous as to give the organism a vesicular or bubble-like appearance. The second kind exhibit regular contraction and dilatation, or pulsate. Gastric vacuoles, or food-vacuoles, occur in connection with the ingestion and digestion of food; these are formed by a globule of water which has been taken in with a particle of food, and are not permanent. See cuts under *Actinosphaerium*, *Noctiluca*, *Paramecium*, *Saur-animalcule*, and *Cestodea*.

4. In *bot.*, a cavity of greater or less size within the protoplasmic mass of active vegetable cells, which is filled with water, or cell-sap as it is called. Active protoplasm possesses the power of imbuing water into its substance and, as a consequence, of increasing in size. When the amount of water is so great that the protoplasm may be said to be more than saturated with it, the excess is separated within the protoplasmic mass in the form of rounded drops called *vacuoles*. In closed cells these may become so large and abundant as to be separated only by thin plates of protoplasm. As such vacuoles become larger the plates are broken through, and eventually there may be but one large vacuole surrounded by a thin layer of protoplasm, which lines the interior of the cell-wall. *Bessey.*

Boundless the deep, because I Am, who fill

Infinite; nor *vacuous* the space.

Milton, P. L., vii. 169.

2. Without intelligence or intelligent expression; unexpressive; showing no intelligence; as, a *vacuous* look.

Thackeray, Newcomes, xli.

vacuousness (vak'ū-us-nes), *n.* The state of being *vacuous*, in either sense; *vacuity*.

vacuum (vak'ū-um), *n.*; pl. *vacuums* (-umz), sometimes *vacua* (-ā). [= *F. vacuum* = *Sp. Pg. It. vacío*, < *L. vacuum*, an empty space, a void, neut. of *vacuus*, empty; see *vacuous*.] Empty space; space void of matter; opposed to *plenum*; in practical use, an inclosed space from which the air (or other gas) has been very nearly removed, as by an air-pump. The metaphysicians of Elea, Parmenides and Melissus, started the notion that a vacuum was impossible, and this became a favorite doctrine with Aristotle. All the scholastics upheld the maxim that "nature abhors a vacuum." This is the doctrine of the plenists. Atomism, on the other hand, carried out in a thoroughgoing manner, supposes empty space between the atoms. That gases do not fill space homogeneously is now demonstrated by the phenomena of transfusion and by the impulsion of Crookes's radiometer; while the other observed facts about gases, taken in connection with these, render some form of the kinetical theory of gases almost certain. This supposes the molecules of gases to be at great distances from one another as compared with their spheres of sensible action. This, however, does not exclude, but rather favors, Bosovich's theory of atoms—namely, that atoms are mere movable centers of potential energy endowed with inertia; and this theory makes each atom extend throughout all space in a certain sense. But this does not constitute a plenum, for a plenum is the exclusive occupation of each part of space by a portion of matter. It may be said that the spaces between the atoms are filled by the luminiferous ether, which seems to be the substance of electricity; but the dispersion of light by refraction seems to show that the ether itself has a molecular structure. A vacuum, in the sense of a space devoid of ordinary ponderable matter, is produced (more or less perfectly) when the air is removed from an inclosed space, such as the receiver of an air-pump, a part of a barometric tube, etc. In the receiver of the ordinary air-pump the vacuum can only be partial, since with each stroke of the piston only a certain fraction of the air is removed (depending upon the relative size of the cylinder and the receiver), and hence, theoretically, an infinite number of strokes would be necessary. Practically, the degree of exhaustion obtained falls short of that demanded by the theory, owing to the imperfections of the machine; thus, in the common form, the exhaustion is limited to the point where the remaining air has not sufficient elasticity to raise the valves. By the Sprengel or mercury air-pump a much more perfect degree of exhaustion is attainable than

with the mechanical form. (See *mercury air-pump*, under *mercury*.) The most perfect vacuum is obtained when chemical means are employed to absorb the last traces of gas left in the receiver exhausted by the mercury air-pump. The Torricellian vacuum—that is, the space above the mercury in a carefully manipulated barometer-tube—is more nearly perfect in this respect, but the space contains a small amount of the vapor of mercury. See *Torricellian*.

Vacuum . . . signifies space without body.

A *vacuum*, or space in which there is absolutely no body, is repugnant to reason.

Descartes, Prin. of Philos. (tr. by Veitch), ii. § 16.

Gueriekian vacuum. See *Gueriekian*.

vacuum-brake (vak'ū-um-brāk), *n.* A form of continuous brake used on railroads, employing a steam-jet directly, and the pressure of the atmosphere indirectly, as a means of controlling the pressure. A steam-jet on the engine is allowed to escape through an ejector, in such a way as to create a partial vacuum in a continuous pipe extending under all the cars of a train. Collapsing bellows under each car are connected with the pipes, and, when exhausted of the air contained in them, close and draw the brake-rods. Two forms are used, the Smith brake and the Eames brake. See *continuous brake*, under *brake*.

vacuum-filter (vak'ū-um-fil'tēr), *n.* A form of filter in which the air beneath the filtering material is exhausted to hasten the process.

vacuum-gage (vak'ū-um-gā), *n.* A form of pressure-gage for indicating the internal pressure or the amount of vacuum in a steam-condenser, a boiler in which the steam has condensed, the receiver of an air-pump, etc. A common form consists of an inverted graduated siphon of glass, open at one end, and connected at the other with the condenser or vessel to be tested, and containing a quantity of mercury. When not in use, the mercury rises equally in both legs of the siphon; on connecting the instrument with a vacuum, the mercury rises in the leg next the condenser or other vessel, and sinks in the other leg, the difference between them indicating the amount of the vacuum. This form is also called *barometer-gage*. *E. H. Knight.*

Vacuum-gage.

vacuum-pan (vak'ū-um-pan), *n.* In the processes of sugar-making, condensed-milk manufacture, etc., a large steam-jacketed vessel of copper or iron, used in boiling and concentrating syrup, milk, etc. Two forms are used, one consisting of two parts bolted together to form a spheroidal vessel, and the other of a drum shape with a domed top. The syrup or milk is placed in the pan, the vessel is closed air-tight, and connections are made by means of pipes with a condenser and air-pump. Steam is admitted to the jacket round the lower part of the pan, and to coils of pipes within it. The air-pump serves to draw off the

vapor from the boiling contents, and to create a vacuum within the pan. The advantages of thus boiling in a vacuum are found in the lower temperature at which boiling takes place, and, as a result, in the greater rapidity of the process and purity of the product. Vacuum-pans are sometimes placed in pairs, the steam from one pan serving to heat the fluid in the second pan. Such an arrangement is called a *double-effect* system. Occasionally three pans are used together, one large pan supplying steam for two smaller pans. This is called a *triple-effect* system. See *sugar*.

vacuum-pump (vak'ū-um-pump), *n.* A pump consisting of a chamber or barrel, a suction-pipe with a valve to prevent return flow, a discharge-pipe which has a valve that is closed when the chamber is emptied, and a steam induction-pipe provided with a valve that is opened when the chamber is filled with water, and closed when the chamber is filled with steam. The chamber is placed at such a height above the water to be raised that the exterior atmospheric pressure will cause the water to rise through the suction-pipe, and fill the partial vacuum caused by condensation of steam in the chamber. Steam being admitted to the chamber forces out the air, and fills the space. The induction-valve is then closed. The loss of heat from the surface of the cylinder, or the sudden injection of a water-spray, condenses the steam. Water then rises, and fills the chamber. Steam is then again admitted, forcing out the water through the discharge-pipe. As soon as the water is discharged and the chamber refilled with steam, the cycle of operations recommences, and it is repeated continuously as long as steam is supplied to the chamber. The opening and closing of the valves have been made automatic in this class of pumps, but they are so wasteful of power that they are very little used. See cuts under *monte-jus* and *pulsometer*. Also called *steam vacuum-pump*.

vacuum-tube (vak'ū-um-tūb), *n.* A sealed glass tube employed to examine the effects of a discharge of electricity through air or other gas rarefied or exhausted to the required degree.

Vacuum-tube.

The most striking phenomenon is the magnificent colored light with which the tube is filled and the stratification of the light about the tube, the color of the light being different at the positive and negative electrodes, and varying with the gas through which the discharge is passed. Thus, in common air it is purple or red at the positive end blue or violet at the negative; in hydrogen, it is greenish-blue; in carbonic acid, bright-green, turning to yellow at the positive, and to blue at the negative. These tubes were first made by Geissler of Bonn, and hence have been called *Geissler's tubes*. A Crookes's tube is a form of vacuum-tube used by Mr. William Crookes in his investigation of what he has called *radiant matter* (which see, under *radiant*). The exhaustion of these tubes is carried to about one millionth of an atmosphere.

vacuum-valve (vak'ū-um-valv), *n.* A safety-valve which opens inward, so connected with a boiler that when there is a vacuum it will be forced open by atmospheric pressure. Also called *air-valve*. *E. H. Knight*.

In law the word *vagrant* has a much more extended meaning than that assigned to it in ordinary language, and in its application the notion of wandering is almost lost, the object of the statutes being to subject to police control various ill-defined classes of persons whose habits of life are inconsistent with the good order of society. In the English statutes *vagrants* are divided into three grades: (a) idle and disorderly persons, or such as, while able to maintain themselves and families, neglect to do so, unlicensed peddlers or chapmen, beggars, common prostitutes, etc.; (b) rogues and vagabonds, notoriously idle and disorderly persons, fortune-tellers and other like impostors, public gamblers and sharpers, persons having no visible means of living and unable to give a good account of themselves, etc.; (c) incorrigible rogues—that is, such as have been repeatedly convicted as rogues and vagabonds, jail-breakers, and persons escaping from legal durance, etc. In the United States the statutes are diverse, but in their general features include to a greater or less extent beggars, drunken parents who refuse or fail to support their children, paupers when dissolute and sick, prostitutes, public masqueraders, tramps, truant, etc.

2. Uncertain as to characters and specific designation, yet limited in scope and application; restricted in logical breadth, without any corresponding fullness of logical depth; said to be determinate, but without precise expression of the determination. Thus, if anything is described as most extraordinary without saying in what respect, the description is *vague*; if a word is understood to have a full import but what that is is doubtful, it is *vague*; if an emotion is strong but unaccompanied by a definite imagination of its object, it is *vague*; if a pictorial figure represents that something exists but fails to show its shape, situation, etc., it is *vague*. This meaning of the word (which occurs seldom before the eighteenth century without an explanatory accompaniment) seems to be derived from the logical phrase *individuum vagum*, meaning a single person or thing, designated as one in number, but without its proper name or any adequate description: as, "a certain man."

A *vague* apprehension of I knew not what occupied my mind.

vagus (vā'gus), *n.*; pl. *vagi* (-ji). [NL. (sc. *nervus*, nerve), < L. *vagus*, wandering; see *vague*.] 1. The tenth cranial nerve, or wandering nerve, the longest and most widely distributed of the nerves of the brain, extending through the neck and thorax to the upper part of the abdomen. It supplies the organs of voice and respiration with motor and sensory fibers, and the pharynx, esophagus, stomach, and heart with motor influence. Its superficial origin is from the medulla, immediately in front of the restiform body and below that of the glossopharyngeal. It passes out of the cranial cavity through the jugular foramen, and accompanies the carotid artery in the neck to the thorax, where the nerves of the two sides differ in their course, that of the right side reaching the posterior surface of the esophagus and stomach, while that of the left goes to the anterior. It gives off very numerous branches, as the meningeal, auricular, pharyngeal, laryngeal, pulmonary, cardiac, gastric, etc., and forms intricate connections with other nerves of the cerebrospinal system, and with nerves of the sympathetic system. Also called *pneumogastric*, *par vagum*, and formerly *second division of the eighth nerve of Willis*.

valence² (vā'lēns), *n.* [< LL. *valentia*, strength, < *valen(t)-s*, strong, ppr. of *valere*, be strong: see *valent, valid*.] 1. In *chem.*, the relative saturating or combining capacity of an atom compared with the standard hydrogen atom; the quality or force which determines the number of atoms with which any single atom will chemically unite. The original statement of the law of valence was that each atom could combine with a certain definite number of hydrogen atoms, or with an equivalent number of atoms of any other element, and that this number was fixed and unalterable. This number expressed the valence, which was a constant, an invariable property of the element. For example, one atom of phosphorus combines with three atoms of chlorine, forming phosphorus trichloride. As the chlorine atom is univalent, phosphorus appears to be trivalent. But in phosphorus pentachloride one atom of phosphorus combines with five of chlorine, and therefore phosphorus in this case appears quivalent. In view of facts like these it is held by some authorities that the valence of an element is a varying quality depending on the nature of the other combining atoms, temperature, etc. By others valence is assumed to be invariable, but the total valence is not always exhibited or

in force. Also called *valency, equivalency*, and, less properly, *atomicity*.

The sentimental class are often highly ornamental and expensive productions, usually bearing pretty pictures on the subject of courtship or matrimony; the comic class are generally coarse and vulgar productions, usually with caricatures of the human form depicted on them, and are often meant to reflect on the personal appearance, habits, character, etc., of the recipient.

Valentinian (val-en-tin'i-an), *a.* and *n.* [< LL. *Valentinianus*, < L. *Valentianus* (see def.), and cf. *valentine*] + *-ian*.] 1. *a.* Of or pertaining to Valentinus or the Valentinians.

II. *n.* A follower of Valentinus, of the second century, the founder of the most influential and best-known of the Gnostic systems. Valentinus was said to have received his doctrines from a pupil of the apostle Paul, and also by direct revelation. He asserted that from the First Great Cause successively emanated thirty eons, male and female, from the last of which, Wisdom, proceeded a being who was the creator of the world. Christ and the Holy Spirit were two eons later created, and Jesus emanated from all the eons; and the

redemption wrought upon earth followed and repeated a redemption wrought in the spiritual world. The Valerianians sought support for their system in an allegorical method of exposition of Scripture, especially of Paul's epistles and the prologue of John's gospel. See *Gnostic, con*, 2, *demurgic*.

Valerianianism (val'en-tin'i-an-izm), *n.* [*Valerianian* + *-ism*.] The system of doctrines maintained by the Valerianians.

valerianite (val'en-tin-it), *n.* [After Basil Valentin, an alchemist of the 15th century, who discovered the properties of antimony.] Native oxid of antimony (Sb_2O_3), occurring in orthorhombic crystals and massive, of a white to brown or pink color and adamantine luster. It has the same composition as senarmontite, but differs in crystalline form. Also called *antimony-bloom*.

Valentin's corpuscles. Small roundish bodies found in nerve-tissue; amyloid bodies.

valeraldehyde (val'e-ral'dē-hid), *n.* [*valer(ian)* + *aldehyd*.] A mobile liquid having an irritating odor (C_9H_9CHO). It is produced by the oxidation of amyl alcohol. Formerly called *valeral*. An isomeric valeraldehyde with a fruit-like odor is also known.

valerate (val'e-rāt), *n.* [*F. valérate*; as *valer(ian)* + *-ate*.] A salt of valerianic acid.

valerian¹ (vā-lē'ri-an), *n.* [Early mod. *E. valerian*; < *ME. valerian*, < *OF. valeriane*, *F. valeriane* = *Pr. Sp. Pg. It. valeriana* = *D. valeriana* = *Dan. valeriana*, < *ML. valeriana*, *valerian*, < *L. Valerianus* or *Valerius*, a personal name, < *valere*, he strong; see *valiant*.] 1. A plant of the genus *Valeriana*. The common, official, or great wild valerian is *V. officinalis*, native through Europe and Asiatic Russia, cultivated for its medicinal root and somewhat for ornament. It is a herbaceous plant with a perennial rootstock; the stem is erect, from 2 to 4 feet high, and furrowed; the leaves are opposite and pinnate; and the flowers are small, white or pinkish,

1. Flowering plant of Valerian (*Valeriana officinalis*); 2, the inflorescence; 3, flower with bract; 4, section of ovary; 5, fruit with pappus.

in terminal corymbs. The root is an official drug having the property of a gentle stimulant, with an especial direction to the nerves, applied in hysteria, epilepsy, etc. Its virtue resides chiefly in a volatile oil—the oil of valerian. It is of a pungent disagreeable odor, which is attractive to cats, and also, it is said, to rats; it is therefore used as a bait. In England in the sixteenth century, valerian, under the name of *setwall*, was regarded as a panacea; but the species appears to have been *V. pyrenaica*, a plant there cultivated, and naturalized from Spain. *V. Phu* from western Asia, called *garden valerian*, is also cultivated, and affords a root of weaker property. *V. Dioscoridis* is believed to be the true valerian or phu (*phu*) of the ancient Greeks. There are three species of valerian in North America, the most notable being *V. edulis*, edible valerian, whose thickened roots, after prolonged cooking in the ground, formerly formed a staple food of the Digger Indians.

As egrenouin, valerian, and lunarie.
Chaucer, *Prolog*, to Canon's Yeoman's Tale, l. 247.

2. The rootstocks of the official valerian, or some preparation from them.

The name is extended to the genus, including the American *P. reptans*, sometimes named *creeping Greek valerian* by translation of the (inapt) specific name. It is a much lower plant than the Jacob's-ladder, with weak stems, flowers light-blue, nodding in small corymbs, delicate, and pretty.—**Oil of valerian.** See *def. 1*.—**Red valerian**, *Centranthus ruber*, native in the Mediterranean region, long cultivated for its handsome oblong panicle of red flowers, which have given it the provincial name of *scarlet lightning*.—**Spur or spurred valerian**, the red valerian; thus named from its spurred corolla-tube. See *Centranthus*.—**Valerian-pug**, *Eupithe-*

Valeriana (vā-lē-ri-ā'nā), *n.* [NL. (Tournefort, 1700; earlier in *Nobel*, 1576); see *valerian*¹.] A genus of gamopetalous plants, type of the order *Valerianæ*, the source of valerian. It is characterized by triandrous flowers with a spurless corolla, and fruit crowned with the pappose limb of the calyx. It contains about 150 species, chiefly perennial herbs with entire, toothed, or dissected leaves, and white or pink flowers, usually in terminal cymes. They inhabit the temperate and arctic regions of both hemispheres, and mountains further south, a few occurring in India and in Brazil. For the species, see *valerian*¹, also *setwall*, *nard*, 4, and *Celtic* and *Cretan spikenard* (under *spikenard*). There are 8 species in the United States, mostly western, with one, *V. scandens*, in southern Florida, and another, *V. pasciflora*, peculiar to the middle of the eastern and central region. *V. sylvatica* occurs from New York, and *V. edulis* from Ohio, northward and westward. See *cut* under *valerian*¹.

Valerianææ (vā-lē-ri-ā'nē-ē), *n. pl.* [NL. (A. P. de Candolle (1815), < *Valeriana* + *-ææ*.] An order of gamopetalous plants, the valerian family. It is distinguished from the three other orders of the cohort *Asterales* by its free anthers and exalbuminous seeds. The flowers are either regular or irregular, commonly with the stamens fewer than the corolla-lobes. The ovary contains a perfect cell with one pendulous ovule (unlike the cret ovule of the related *Compositææ*), and differs from all the related orders in the usual addition of two empty or rudimentary cells. There are about 275 species, belonging to 9 genera, of which *Valeriana* (the type), *Fedia*, *Nardostachys*, *Centranthus*, and *Valerianella* are the most important. They are natives of cold north temperate regions of the Old World, more abundant in America, especially in the west and the Andes. They are annual or perennial herbs, occasionally somewhat shrubby, usually with a peculiar odor, sometimes a source of perfumes, as in *spikenard* and some valerians. They bear opposite leaves, often mostly radical, and flowers usually sessile in dichotomous cymes, either white, red, or bluish, or, in the genus *Patrinia*, yellow. Although the order is closely related to the *Compositææ*, the inflorescence is seldom at all capitate or involuclate. The fruit is an achene crowned with the persistent border of the calyx. Many of the species are highly esteemed in medicine for tonic, anti-spasmodic, or stimulating properties.

Valerianella (vā-lē'ri-ā-nel'ā), *n.* [NL. (Tournefort, 1700), < *Valeriana* + *dim. -ella*.] A genus of gamopetalous plants, of the order *Valerianææ*, chiefly distinguished from *Valeriana* by its toothed, lobed, awned, or horned, but never pappose calyx. There are about 55 species, annual herbs, dichotomously branched, with entire, dentate, or pinnatifid leaves, and cymes of white, pale-blue, or pink flowers. The genus is chiefly confined to the Mediterranean region, extending into central Europe, but occurs in North America, and a few species are widely naturalized. Several species produce tender foliage, eaten as lettuce. *V. distorta*, a species with pale-green leaves and small slate-colored flowers, widely diffused in Europe, North Africa, and Asia, formerly known as *schite pot-herb* and *lamb's-lettuce*, and latterly as *corn-salad*, is now often cultivated under glass as an early salad under the name of *fetticus*. (See *cut* under *dichotomy*.) Twelve species, formerly classed under the related monotypic genus *Fedia*, are natives of the United States; four species of Oregon are peculiar in their spurred corollas. *V. Woodsiana*, with roundish, and *V. chenopodiifolia* (*Fedia Fagopyrum*), with somewhat triangular fruit, extend from the south into New York.

The Rom. forms were prob. confused with *ML. vallata*, *f.*, also *vallatum*, *n.*, a ditch, a place surrounded by a ditch, < *L. vallatus*, pp. of *vallare*, surround with a rampart or intrenchment: see *vallate*.] 1. A depression, or a relatively low and somewhat level area, more or less completely inclosed by hills or mountains; the basin of a stream of any size, or the area drained by it, and, in accordance with more general usage, the part of that area which lies near the stream and is not much raised above its level. The surface of a mountainous region is made up of hills (or mountains) and valleys; but over those great expanses of country where uniformity of level is the dominant feature the term *valley* gives way to some other designation more specific in its character: thus, in English, *heath*, *prairie*, *savanna*, *plain*, *desert*; in Spanish-speaking countries, *campo*, *pampa*, *llano*, *padrano*; in the Russian empire, *steppe*, *tundra*; in South Africa, *veldt*, etc. All the tracts thus designated lie within the basins of certain rivers, and thus technically form parts of the valleys of those rivers, but convenience demands and justifies the special designation. So, on the other hand, in mountainous countries, or even in those in which the surface is only moderately broken, the valleys have their forms characterized by terms suited to express the great variety of features which they exhibit: thus, in English, *dale*, *dell*, *dingle*, *cone*, *comb*, *gully*, *ravine*, *gorge*, *defile*, *chasm*, and many others; in French, *combe*, *cluse*, *cirque*, etc.; in Spanish, *cañada* (changed to *cañon* in the western United States), *barranca*, *quebrada*, etc.; and so through all the various languages and countries. The forms of valleys are so numerous, and their existence dependent on such complicated and varied conditions, that a satisfactory classification of them is not possible. The simplest division of them, from the orographic point of view, is into *longitudinal* and *transverse*: the former are parallel with the mountain-ranges to which they belong; the latter, more or less nearly at right angles to them. Of longitudinal valleys the "Great Valley" of the Appalachian range offers an excellent example, this being parallel with the Blue Ridge, and having a development of about 500 miles in length in Pennsylvania and Virginia, and a very uniform width within those States of rarely less than 12 or more than 20 miles. The valleys of the Rhone and the Rhine in their upper portions — which rivers start from near the same point, and flow in exactly opposite directions, parallel with the crest of the Alps — furnish another good illustration of a longitudinal valley; while an equally satisfactory example of a transverse one is seen in the course of the Rhone from Martigny to the Lake of Geneva, where that river follows a direction at right angles to that which it has in the upper part of its course. Longitudinal valleys are more distinctly orographic in character than are the transverse — that is, their origin is due primarily to the same causes which have governed the position and direction of the ranges which make up the mountain-system to which they belong. Transverse valleys, on the other hand, though not necessarily independent of preëxisting breaks and faults, are, in general, chiefly the result of erosive agencies — by which, indeed, the forms of almost all valleys have been more or less profoundly modified. In some chains, however, notably in the Himalayas, the tendency of large streams flowing in longitudinal valleys to break transversely through lofty and precipitous ranges, and pass out of what seems their natural and predestined course, is an extraordinary orographic feature, and one which has not received a satisfactory explanation.

For he chased a saine that he hath overtake in this derke valey, and hath hym smetyn down.

See *cream*¹. — *Synclinal valley*. See *synclinal*. — *Valley of the cerebellum*. Same as *vallecula cerebelli* (which see, under *vallecula*). — *Syn. 1. Valley, Vale, Dale, Glen, Ravine, Defile, Gorge, Cañon*. These words differ a good deal, according to locality. *Valley* is the general word (see def.), but may represent a region much larger than any of the others: as, the *valleys* of the Amazon and the Mississippi. *Vale* is a poetic or elevated word for a small valley. *Dale* belongs chiefly to the north of England, and is used of a small valley, especially if cultivated or cultivable. The popular notion of a *glen* is that it is secluded and shady. A *ravine* is narrow and relatively long. A *defile* is a narrow passage-way, especially among hills — a pass so narrow that troops can go through only by a narrow front, as by files. A *gorge* is presumably deep, with sides somewhat if not quite precipitous. *Cañon* is a local word (see def.), without figurative extension as yet.

Vallisneria (val-is-nō-rī-ā), *n.* [NL. (Micheli, 1729), named after Antonio Vallisneri (1661–1730), an Italian naturalist.] 1. A genus of monocotyledonous plants, of the order *Hydrocharidæ*, type of the tribe *Vallisneriæ*. It is distinguished from the other two genera of the tribe by its simple perianth, fewer stamens (one to three), and the absence of a beak to the fruit. There is but one species, *V. spiralis*, the tape-grass or cel-grass, an aquatic plant common in fresh water, especially slow-flowing rivers, throughout the temperate and warmer regions of both hemispheres. It is a submerged herb with a very short stem, sometimes stoloniferous; very long and narrowly linear leaves crowded together at the base within a short sheath; and dioecious flowers on scapes, the male scapes very short, bearing clusters of buds within a spathe. These buds break from their short pedicels, and rise to the surface, where they open, and shed their pollen among the fertile flowers, which are raised to the surface on long filiform scapes. These latter subsequently coil up spirally, drawing the fertilized flowers under water to mature their fruit, which is berry-like, cylindrical, and elongated, and filled with numerous oblong seeds. The plant is common in cultivation in aquariums, its rapid growth adding to aerate the water. In streams flowing into Chesapeake Bay, where it grows in great masses, it is known as *water-celery* or *wild celery*, and is said to be a favorite food of the canvasback duck and of the terrapin, and to impart to them their peculiar flavor. In Australia it is locally known as *spring-plant*. The square or oblong cells of its delicate flat leaves often exhibit to a remarkable degree the phenomenon of cytolysis, or active movement of protoplasm, the current of protoplasm carrying all the cell-contents, including the chlorophyll-grains and nucleus, in continual rotation around the cell, close to the inside of its wall. It is therefore much used for laboratory demonstration. See out under *dioecious*.

2. [*l. c.*] A plant of this genus.

Vallisneriaceæ (val-is-nō-rī-ā'sē-ē), *n. pl.* [NL. (Link, 1829), < *Vallisneria* + *-acæ*.] A former name of the order *Hydrocharidæ*.

Vallisneriæ (val'is-nō-rī-ā'sē-ē), *n. pl.* [NL. (Endlicher, 1836), < *Vallisneria* + *-æ*.] A tribe of plants, of the order *Hydrocharidæ*, characterized by very short, sometimes stoloniferous stems, growing immersed in fresh water, producing crowded sessile elongated leaves and peduncled spathes. It consists of 3 monotypic genera, *Vallisneria* being the type.

Vallota (va-lō'tā), *n.* [NL. (Herbert, 1821), said to have been named after *Vallot*, a French botanist (beginning of 17th century).] A genus of plants, of the order *Amaryllidææ* and tribe *Amaryllidææ*. It is characterized by a broadly funnel-shaped perianth with short tube usually involucre with three bracts, furnished with a small callus between contiguous lobes, and by numerous ovules in two vertical rows in each cell, ripening into winged seeds. The only species, *V. purpurea*, is a native of South Africa. It is a bulbous plant with thong-like leaves and a stout scape bearing an umbel of numerous large scarlet flowers, erect and nearly or quite sessile. It is cultivated under the name of *Scarborough lily*.

vallum (val'ūm), *n.*; pl. *valla* (-ā). [*L.*, a rampart: see *wall*.] 1. A rampart; a palisaded rampart; a line of intrenchment; specifically,

valuable (val'ū-ā-bl), *a.* and *n.* [Early mod. E. also *valiable*; altered, to suit value (as if directly < *value* + *-able*), < *OF. valable*, of force or value, *valuable*, < *valoir*, be of force or value: see *value*.] I. *a.* 1. Valuable consideration. See *consideration*. — *Syn. 2* and 3. *Valuable*, *Costly*, *Precious*, useful, serviceable. That is *valuable* which has value, however small, and whether pecuniary or otherwise. That is *costly* which has cost or would cost a large sum of money: figuratively, we may sometimes call that *costly* which has cost work, sacrifice, or the like, or inflicted loss: as, a *costly* mistake or victory; but such use is not common. That is *precious* which has a

very high intrinsic value: hence the term "precious metals"; a precious stone is also called a jewel; figuratively, a precious child is one very dear for his own sake. A costly stone is one that has been made expensive by carving, polishing, transportation from a great distance, or the like, as the sarcophagus of Napoleon I.; in 1 Cor. iii. 12 the revised version corrects "precious stones" to "costly stones." A valuable stone is one that can be made useful in some way, and therefore must not be thrown away. That which we value for its associations would be called more or less precious or dear, rather than valuable.

II. n. A thing, especially a small thing, of value; a choice article of personal property; any piece of precious merchandise, usually of small bulk; generally in the plural.

Home valuation, valuation or appraisement of imported merchandise according to the market prices at the port of import: in contradistinction to *foreign valuation*, the method commonly in use by appraising according to the valuation of the foreign port or country of export. The principle of home valuation was introduced in the United States by the act of Congress of March 2d, 1833, which provided for a gradual reduction of duties, to be followed in 1842 by the principle of home valuation according to regulations to be prescribed, which, however, were never introduced.

2. Estimated or attributed worth; appreciation; valuation; esteem; regard.

3. The amount of other commodities (commonly represented by money) for which a thing can be exchanged in open market; the ratio in which one thing exchanges against others; the command which one commodity has over others in traffic; in a restricted (and the common popular) sense, the amount of money for which a thing can be sold; price. In political economy value is distinguished from price, which is worth estimated in money, while value is worth estimated in commodities in general.

So the departed to pore knights and squeres that neuer after were pore, In so moche that thei kepte not to hem-self the value of a peny.
Merlin (E. E. T. S.), II. 167.

They [the Switzers] found there great apoyles that the Duke left behind, to the value of three Millions.

Coryat, Crudities, I. 42.

By the price of a thing, therefore, we shall henceforth understand its value in money; by the value, or exchange value of a thing, its general power of purchasing, the command which its possession gives over purchasable commodities in general.
J. S. Mill, Pol. Econ., III. i. § 2.

The word value, so far as it can be correctly used, merely expresses the circumstance of its [a commodity's] exchanging in a certain ratio for some other substance.

Jevons, Pol. Econ., iv.

He could not manage finance; he knew values well, but he had no keenness of imagination for monetary results in the shape of profit and loss.

George Eliot, Middlemarch, xxiv.

The sense proper to value in economic discussion may, I think, be said to be universally agreed upon by economists, and I may, therefore, at once define it as expressing the ratio in which commodities in open market are exchanged against each other.

J. E. Cairnes, Pol. Econ., I. i. § 1.

4. Price equal to the intrinsic worth of a thing; real equivalent.

His design was not to pay him the value of his pictures, because they were above any price.
Dryden.

5. Impert; precise signification: as, the value of a word or phrase.—6. In music, the relative length or duration of a tone signified by a note: as, a half-note has the value of two quarter-notes, or four sixteenth-notes; to give a note its full value.—7. In painting and the allied arts, relation of one object, part, or atmospheric plane of a picture to the others, with reference to light and shade, the idea of hue being abstracted. Thus, a picture in which the values are correct is one in which the distribution and interdependence of the light and dark parts correspond to nature, and particularly preserve the correct rendering of different distances from the observer; while a detail in a picture which is out of value is one which is too light or too dark in tone for the atmospheric plane which it should occupy, or for the proper rendering of its relations to other objects in the same plane.

It strikes us that the figure of the young preacher standing erect in the lofty pulpit has less value and atmospheric envelopment than it should possess in relation to the rest of the composition.
The Academy, No. 890, p. 365.

With all our knowledge of to-day, the values of this landscape could not be better expressed; the composition is most natural and original, and were it not for the lack of truth in the values of the figures, and for the intense plety of the sentiment, it might have been painted yesterday.
Scribner's Mag., IV. 717.

8. In math., the special determination of a quantity. Quantities in mathematics are identified by their general definitions, as satisfying certain conditions, and are variable, or otherwise indeterminate. A completely determinate quantity, or, more precisely, the quantity of a completely determinate quantum, is a value. Value is distinguished from magnitude in that the latter refers only to a modulus, or numerical measure, neglecting in some measure distinctions of kind, while two quantities which are not equal have not the same value, though they may have the same magnitude.

9. In biol., grade or rank in classification; valence: as, a group having the value of a family.—Annual value. See *annual*.—Form value, in biol., morphic valence; that grade of structural simplicity or complexity which any organism presents, or represents as compared with another: as, an ovum and an amoeba have alike the form value of the simple cell; any sea-urchin has the form value of echinoderms.—Good value, full value or worth in exchange: as, to get good value for one's money.—Local, market, minimum, multiple, par, principal value. See the qualifying words.—Surplus value. See the quotation.

The fundamental principle of the Marx school and of the whole cognate socialism is the theory of surplus value,—the doctrine, namely, that, after the labourer has been paid the wage necessary for the subsistence of himself and family, the surplus produce of his labour is appropriated by the capitalist who exploits it.
Encyc. Brit., XXII. 211.

Surrender value. See *surrender*, 2.—Terminal value. See *terminal*.—Value in exchange, exchange value, and exchangeable value, phrases often used to distinguish value in the economic sense (see def. 3) from its more general meaning of 'utility.'

The things which have the greatest value in use have frequently little or no value in exchange; and, on the contrary, those which have the greatest value in exchange have frequently little or no value in use.
Adam Smith, Wealth of Nations, i. 4.

Value of money. See *money*.—Value received, a phrase used especially to indicate that a promissory note has been made, or a bill of exchange has been accepted, for a valuable consideration, and not by way of accommodation.—Syn. 1-4. Worth, Cost, etc. (see *price*), Income, Revenue, Profit, etc. See *income*.

2. Any device or appliance used to control the flow of a liquid, vapor, or gas, or loose material in bulk, through a pipe, passageway, outlet, or inlet, in any form of containing vessel. In this wide and general sense, the term includes air-, gas-, steam-, and water-cocks of any kind, water-gates, air-gates, and keys to musical wind-instruments. *Rotary valves* are valves in which the leaf, disc, plug, or other device used to close the passage is made to revolve for opening or closing (the common stop-cock being an illustration); *lifting-valves* are those in which the ball, cone, or other stopper is lifted or raised clear of the valve-seat by pressure (usually that of the gas, steam, or liquid in the pipe) from below, the *poppet*, *ball*, and *safety-valves* being examples; *hinged valves* constitute a large class used in both air- and water-pipes, as the *butterfly-valves*, *clack-valves*, and other forms in which the leaf or plate of the valve is fastened on one side to the valve-seat or opening. Springs are sometimes used to keep such valves closed. *Sliding valves* are those in which the gate or leaf slides aside to open the valve-way, the *D-valve* and some forms of water- and gas-main valves being examples. The long-hinged valves of a pipe-organ, and the round stoppers operated by keys, as in the flute and other instruments, are called *key-valves*. The names by which valves are distinguished are often descriptive of the shape or motion of the valves, of their use, or of the method by which they are operated, as *globe-valve*, *screw-valve*, *blow-through valve*, *relief-valve*, *throttle-valve*. In a trade sense, *valves* appear to be distinguished from *cocks*. A cock is a small plug-valve operated by hand. Other valves moved by screws or levers, or operated by power through some machinery, all self-acting appliances, and all large or complicated gates, stoppers, or cocks, are called *valves*. The universal use of steam, gas, and water has led to the invention of a great variety of valves. In musical wind-instruments of the trumpet class, the valve is a device for changing the direction and length of the air-column so as to alter the pitch of the tone. The two forms most in use are the piston and the rotary valve—the former being a perforated plunger working in a cylindrical case, and the latter a four-way cock, both being operated by the fingers of the player's right hand. The result of using a valve is to add to the main tube of the instrument a supplementary tube or crook of such length that the proper tone of the whole is lowered by some definite interval. The number of valves is commonly three, the first lowering the fundamental tone a whole step (and all its harmonics proportionally), the second lowering it a half-step, and the third a step and a half. A fourth valve is sometimes added on large instruments, lowering the pitch two steps and a half; and five and six valves have occasionally been tried. Two or more valves are used simultaneously with combined effect. Valves are more or less demanded to compensate for the incompleteness of the scale of all instruments of this family, and to provide for rapid changes of tonality. They are also useful in particular cases to remedy the inaccuracy for concerted music of certain of the regular harmonic series of tones. Their extended application has greatly developed the capacity of all kinds of brass instruments for rapid and unrestricted execution. But on the other hand valves and supplementary crooks cannot always give exactly accurate intonation, and the angles which they more or less necessitate in the air-column tend to injure the purity of the tones. Various compensations for these drawbacks have been attempted, with some success; but valve-instruments are still seldom used in the orchestra, while they are numerous in military bands. See *piston*, 2, and compare *key*, 4 (a). See cuts under *back-pressure*, *ball-cock*, *conical organ*, *reed-organ*, *twin-valve*, *slide-valve*, *steam-engine*, *safety-valve*.

Dead wizards, werewolves, heretics, and other outcasts become vampires, as do also the illegitimate offspring of parents themselves illegitimate, and any one killed by a vampire. vampire-bat (vam'pír-bat), *n.* One of several different species of bats. (a) One of various large frugivorous bats of Africa, Asia, and the Malay archipelago, commonly called *flying-foxes*, such as the species of *Pteropus, Harpyia*, etc. The name appears to be due to some superstition, or to a fancied resemblance of these creatures to the spectral beings denominated vampires. (b) One of various bats of South America, of the insectivorous division of the order *Chiroptera*, only a few of which are noted for sucking blood. (1) There are numerous species of several genera of the family *Phyllostomatidae*, among them the *Phyllostoma spectrum*, popularly known as the vampire-bat, some two feet in expanse of wing. But this species, like most others of the family, is perfectly harmless. (2) The bats which actually suck blood belong to the genera *Desmodus* and *Diphylla*, for which a special group named *Hæmatophilina* or *Desmodontes* has been formed, and which are also sometimes separated as a family, *Desmodidæ*. These have a small bifid foliaceous appendage on the nose; the tail and interfemoral membrane are little developed. Their peculiar characteristics are two large projecting upper incisors and two lancet-shaped superior canine teeth, all sharp-pointed, and so arranged as to make a triple puncture like that of the leech; a tongue capable of considerable extension, and furnished at its extremity with a number of papillæ arranged so as to form an organ of suction; and an intestine relatively shorter than in any other mammal. Altogether their structure points them out as designed to live on blood alone. They attack horses and cattle, and sometimes even man in his sleep. Also *vampire* and *vampyre*. See cuts under *Desmodontes*.

vanadium (vā-nā'di-um), *n.* [See def.] Chemical symbol, V; atomic weight, 51.4. A metal first discovered by Del Rio, in 1801, in a lead ore from Mexico, and called by him *erythronium*, because its salts became red when heated with acids. This supposed new metal was not accepted by chemists, and Del Rio's name was dropped. Later, in 1830, Selström described a new metal from Taberg, in Sweden, for which he proposed the name of *vanadium* (from *Vanadis*, one of the goddesses of the Scandinavian mythology); and immediately after it was shown by Wöhler that Del Rio's ore was, in fact, a vanadate of lead. But the name *vanadium* has been maintained, and that of *erythronium* has never been received. Metallic vanadium, as prepared by reducing the chlorid in hydrogen gas, is a light-gray powder, which under the microscope has a brilliant silvery luster; it has a specific gravity of 5.5; it is very little acted on by air or moisture at the ordinary temperature; it is easily dissolved in nitric acid, but is not at all acted on by hydrochloric acid, and is affected by strong sulphuric acid only when heated. Vanadium belongs to the antimony group, and, like the other members of this group, is in its chemical relations closely connected with the elements of the nitrogen group. Vanadium is an element whose combinations seem to be quite widely distributed, although occurring only in small quantity. The most abundant vanadium mineral is vanadinite, which is a vanadate of lead with chlorid of lead, and has been found in numerous widely separated localities. Vanadium resembles titanium in that it has been detected in various clays and igneous rocks. It is obtained in some quantity from the cupiferous Triassic beds of the vicinity of Mottram, Cheshire, England, in the form of the so-called mottramite, a hydrous vanadate of copper and lead.—**Vanadium bronze**, a fine yellow pigment employed in the place of gold bronze. It is an acid derivative of vanadium.

Vancouveria (van-kō-vē'r-i-ē), *n.* [NL. (DeCaisne, 1834), named after Captain *Vancouver*, an English navigator, who visited the western coast of America 1792-4.] A genus of polypetalous plants, of the order *Berberidaceæ* and tribe *Berberææ*. It is characterized by twelve to fifteen sepals, six shorter nectary-like petals and as many stamens, and a capsule opening into two valves. The original species, *V. hexandra*, is a perennial herb growing from a creeping rootstock, native of shady woodlands near the Pacific coast from Santa Cruz to Vancouver Island. It bears dissected radical leaves, and a panicle raceme of white flowers on a leafless scape. It has been called *American barnevort*, from its close resemblance to the European *Epimedium alpinum*, which has the reputation of possessing sterilizing powers. (See *barnevort*.) A second North American species has been recently discovered.

Vanda (van'dā), *n.* [NL. (R. Brown, 1820), said to be *< Skt. vandana*, a parasite.] 1. A genus of epiphytic orchids, of the tribe *Vandææ* and subtribe *Sarcandheæ*. It is characterized by unbranched loose racemes of rather large flowers with very flat and spreading fleshy sepals and petals, all usually nearly alike and contracted below; a lip with a saccate base; broad pollen-stalks; and an unappendaged column. There are about 20 species, natives of India and the Malayan archipelago, with one, *V. Hindsiæ*, in tropical Australia. They bear spreading, flat, two-ranked leaves, commonly fleshy or coriaceous, and often notched at the apex—in one species, *V. teres*, cylindrical, and resembling a goose-quill. The handsome short-pedicelled flowers are borne on a lateral peduncle. Many species are in cultivation under glass, and from their size, fragrance, beautiful colors, and ornamental markings, are among the most highly prized of orchids, a single plant of a rare species having brought \$2,000. They are grown on suspended blocks of wood or cork, and produce several, sometimes forty, flowers on a plant at once. *V. teres*, the cylinder-leaved vanda, a native of Sylhet, in India, bears blood-red white-bordered flowers 4 inches broad. *V. cœrulea*, with equally large bright-blue flowers, grows on the oak and banian in India; this and *V. cœrulescens*, with numerous smaller pale-blue flowers, are unusual in color among orchids. *V. insignis* and *V. swartzii* are favorites in cultivation for their fragrance; *V. tricolor*, for its violet, white, and yellow flowers; *V. gigantea*, for its thick massive leaves. *V. furva*, sometimes called the *cowslip-scented orchid*, bears brownish, rose, and copper-colored flowers; and several species are cinnamon-colored.

2. [*l. c.*] A plant of this genus.

Vandææ (van'dē-ē), *n. pl.* [NL. (Lindley, 1833), *< Vanda + -ææ.*] A tribe of orchids, characterized by a single posterior opercular anther, its cells almost always confluent at maturity, and closely incumbent above a horizontal rostellum, to which the waxy pollen-masses are affixed by a small thick or scale-like gland, which is often prolonged into a distinct earlike or stalk. It includes about 140 genera, classed in 8 tribes, the types of which are the genera *Eulophium*, *Cymbidium*, *Cyrtopodium*, *Stanhopea*, *Maxillaria*, *Oncidium*, *Sarcanthus*, and *Notylia*. These genera alone include over 530 tropical species, and are all, except perhaps the first and last, highly prized in cultivation. The *Notylieæ* (or *Podochileæ*) are aberrant in their erect rostellum, and are thus transitional to the tribe *Notylieæ*. The two globose or oblong pollen-masses, each sometimes bisected, are very readily removed by insect or artificial aid, and insure cross-fertilization. The genera are nearly all epiphytic. They often produce pseudo-bulbs, but not tubers; their stems are erect, or reduced to a creeping rootstock adhering to trees or stones; their inflorescence is usually lateral, very rarely, as in *Cyrtopodium*, a terminal raceme. The flowers are commonly large and handsome, many of the most valuable among orchids being found here, as *Aerides*, *Miltonia*, *Saccolabium*, *Odontoglossum*, *Phalænopsis*, *Zygopetalum*, *Lycaste*, *Catasetum*, and *Peristeria*. See cut under *Phalænopsis*.

It is distinguished from the related genus *Ilysanthes* by its four perfect stamens. There are about 30 species, natives of warm parts of the Old World, 2 species, *V. crustacea* and *V. diffusa*, occurring in tropical America. They are usually much-branched annuals, with opposite leaves, and small flowers which are solitary in the axils, or form a terminal raceme or umbel. See *bitter-bain*.

vanilla (vā-nil'ā), *n.* [= *F. vanille, < NL. vanilla, < Sp. vainilla, formerly vainilla, the pod or bean of the vanilla-plant, hence also the plant itself (also applied to heliotrope), lit. 'little pod,' dim. of vaina, scabbard, sheath, pod, < L. vagina, sheath: see vaina.*] 1. A plant of the genus *Vanilla* (see *def. 3*), especially one of several species yielding the vanilla of commerce.

Flowering Branch of *Vanilla planifolia*,
a, the fruit.

V. planifolia is by far the largest source; but other species, as *V. aromatica* and *V. grandiflora*, are also grown for use. Vanilla is most largely produced in Mexico, the product being obtained to a great extent from the wild plant; but the plant is also found, either wild or in cultivation, in various parts of Central and South America, and is more or less grown in many warm countries, notably in Mauritius and the Seychelles, Java, and Tahiti. On the isthmus of Pana-

ma the fruit of *Selenipedium Chica*, and perhaps of some other orchids, there known as *vanilla chica*, or little vanilla, is used like that of true vanilla. The vanilla-plant is a climber easily propagated by cuttings, beginning to bear when three years old, and continuing thirty or forty years. The flowers need to be artificially fertilized, except in the plant's natural habitat, where fertilization is effected by insects. The fruit is a long fleshy pod, known as *vanilla-bean*, from its form, not from its seeds, which are minute.

2. The vanilla-bean or its economic extract. The valuable property of the bean, which resides in a volatile oil (see *vanillin*), is developed by a slow process of curing involving fermentation. The extract has a peculiar agreeable odor and aromatic taste. It has the medicinal property of an aromatic stimulant, with some effect upon the nervous system. Its chief use, however, is in the preparation of liquors, in perfumery, and as a flavoring of chocolate, confectionery, creams, etc.

3. [*cap.*] [NL. (Plumier, 1703).] A genus of orchids, of the tribe *Neottieae*, type of the subtribe *Vanilleae*. It is characterized by having tall climbing and branching leafy stems, and large flowers with a broad concave stalked lip, at the base rolled about the column, to which the stalk is adnate. There are about 20 species, widely scattered through the tropics. They are robust climbers, sending out adventitious roots, by which they cling to trees, and bearing thick fleshy or coriaceous leaves. The flowers are usually large, often abundant, and of delicious fragrance, chiefly white and red, in several economic species green. The dark-brown pods are 6 to 9 inches long, and are filled with a dark oily odoriferous pulp. (See *def. 1* and *vanilloes*.) The Jamaican species are there known as *greenwithe* and *purplelip*. *V. planifolia* occurs also in Florida along the everglades, where its green flowers reach about 2 inches in diameter. *V. luteocens* and *V. phalaenopsis* are cultivated under glass for their flowers, which are large and handsome, yellowish, white, or orange.—**Frosted vanilla** (*F. vanille givrée*), vanilla-beans upon the surface of which vanillin appears in frost-like crystals: the best quality. *A. W. Harrison*.—**Wild vanilla**, a composite plant, *Trichia (Liatris) odoratissima*, found from North Carolina to Florida and Louisiana. It is a rather tall erect plant with numerous small rose-purple heads in a cymose panicle. The leaves have a persistent vanilla-like fragrance, and are considerably used to improve the odor of tobacco. The root-leaves are much larger than the others, and gain for the plant the name also of *deer's-tongue* or *hound's-tongue*.

vanilla-bean (vā-nil'ā-ben), *n.* The fruit of the plant vanilla. See *vanilla, 1* and *2*.

vanilla-grass (vā-nil'ā-grās), *n.* A grass of the genus *Hierochloë*, chiefly *H. borealis*; holy-grass. The large-leaved vanilla-grass is *H. macrophylla* of California. See *Hierochloë*.

vanillin (vā-nil'in), *n.* [*< vanilla + -in².*] The neutral odoriferous principle (C₈H₁₀O₃) of vanilla. It forms crystalline needles having a hot, biting taste, soluble in hot water and in alcohol. It is now prepared artificially from coniferin and from oil of cloves, and used as a flavoring extract.

vanillism (vā-nil'izm), *n.* [*< vanilla + -ism.*] An affection observed among workers in vanilla, characterized by an itching papular eruption of the skin, irritation of the nasal mucous membrane, headache, vertigo, pains in the muscles, and great prostration. It is supposed to be due to a poisonous action of the vanilla or of the oil of cashew with which the pods are coated.

vanilloes (vā-nil'ōz), *n.* An inferior kind of vanilla obtained from *Vanilla Pompona*.

vanner (van'ér), *n.* [*< van¹ + -er¹.*] In *mining*, a machine for dressing ore; an ore-separator; a vanning-machine. The name is given to various contrivances patented and attempted to be brought into use for dressing ore, in which the peculiar motions of the shovel in the miner's hands in the operation of "making a van" are, or are supposed to be, more or less successfully imitated. "Berdan's machine" is one of these contrivances, and has been used to some extent in California and elsewhere. The most satisfactory machine of this kind is the so-called "Frue vanner," which is now widely known and somewhat extensively used. In this machine various well-tried methods are combined with a satisfactory result; but it cannot be said to be as close an imitation of the "vanning motion" as Berdan's is. It is, in fact, a combination of the principle of giving side-blows, adopted in Rittinger's "side-blow percussion-table," with that of feeding the ore on an endless traveling belt, slightly inclined in position, on which the ore is subjected to the action of a stream of water. "It has the defect of being able to treat a binary ore only, or at least to furnish only two products." (*Callon*.)

2. In *physics*, the gaseous form which a solid or liquid substance assumes when sufficiently heated. Vapor is essentially gas, and; since all known gases have now been proved to be liquefiable, no physical difference can be said really to exist between an ordinary gas, such as oxygen, and a vapor, such as steam. In common language, however, a difference is usually recognized: a *gas* is a substance which at ordinary temperatures and pressures exists in the gaseous state, while a *vapor* is the gaseous form of a substance which normally exists in a solid or liquid form. An important distinction exists between a saturated vapor (one which is on the point of condensation) and a non-saturated vapor (one which can be compressed or cooled to a certain extent without condensation). The latter obeys Boyle's and Gay-Lussac's laws of gases; in the former, however, increased compression produces condensation, but does not change the pressure of the vapor, which is a function of the temperature alone. Superheated steam is a non-satu-

raised vapor. Aqueous vapor is always present as a minor constituent of the atmosphere, and its amount, which is very variable both at different places on the earth's surface and in the same locality at different times, forms an important element of climate. By a reduction of temperature the aqueous vapor in the air is brought to the so-called state of saturation, and then condensed into cloud, mist, and rain. See *rain*.

It would be an error to confound clouds or fog or any visible mist with the *vapor* of water; this *vapor* is a perfectly impalpable gas, diffused, even on the clearest days, throughout the atmosphere.

vari², *n.* Plural of *varus*.

variability (vā'ri-a-bil'i-ti), *n.* [= F. *variabilité* = Pg. *variabilidade* = It. *variabilità*; as *variable* + *-ity*.] 1. The quality or state of being variable; variableness.

A very few nebulae have been suspected of *variability*, but in almost every instance the supposed change has been traced to errors of observation, impurity of the atmosphere, or other causes.

Appleton's *Ann. Cyc.*, 1886, p. 56.

2. In *biol.*, ability to vary; capability of variation; susceptibility to modification under conditions of environment, whether inherited or acquired; that plasticity or modifiability of any organism in virtue of which an animal or a plant may change in form, structure, function, size, color, or other character, lose some character or acquire another, and thus deviate from its parent-form; also, the kind or rate of variation in a given instance; the fact or act of varying. See *variation*, 8, *variety*, 6. Variability or mutability of some kind and to some extent is inherent in all organisms, and is transmissible like any other natural attribute or quality; it is therefore scarcely the antithesis of *heredity* (though the latter term often indicates or implies such fixity of type as an organism may derive from its parent-form, and which causes it to retain that form instead of acquiring a different form); yet *variability* has somewhat explicit reference to the tendency of organisms to become unlike their parents under external influences, and so to adapt themselves to their surroundings. Hence *variabil-*

ity, though intrinsic, is called into play by the extrinsic conditions under which organisms vary, and in this way is counteractive of heredity, or the tendency to breed true. (See *atavism* and *selection*, 3.) The old notion of species as special creations, and as among the "constants of nature," subject to variation within very narrow limits which are themselves fixed in every case, finds no place in modern biological conceptions. (See *species*, 5.) The actual extent of variation which results from variability has been realized in all its significance only within the past thirty years, during which observations in every branch of natural history have demonstrated the universality of the fact, and shown the average rate or degree of variability to be much greater than had before been suspected. The cases of domestic animals and plants, first systematically studied by Darwin with special reference to variability, proved to be much less exceptional than they had been assumed to be; and the results of extending the same researches to the variability of organisms in a state of nature may be said to have entirely remodeled biology. See *Darwinism* and *evolution*, 2 (a), (b).

We see indefinite variability in the endless slight peculiarities which distinguish the individuals of the same species, and which cannot be accounted for by inheritance from either parent or from some more remote ancestor. Darwin, *Origin of Species*, p. 23.

3. In *astron.*, the fact that a star or nebula changes its brightness in a more or less periodic manner.—**Generative variability**, in *biol.*, inherited variability; inherent tendency to vary away from ancestral characters, and thus not to revert or exhibit atavism. See the quotation.

It is only in those cases in which the modification has been comparatively recent and extraordinarily great that we ought to find the generative variability, as it may be called, still present in a high degree. For in this case the variability will seldom as yet have been fixed by the continued selection of the individuals varying in the required manner and degree, and by the continued rejection of those tending to revert to a former or less-modified condition. Darwin, *Origin of Species*, p. 154.

variable (vā'ri-ā-bl), *a.* and *n.* [*F.* *variable* = *Sp.* *variable* = *Pg.* *variavel* = *It.* *variabile*, < *LL.* *variabilis*, changeable, < *L.* *variare*, change; see *vary*.] **I.** *a.* 1. Apt to change; changing or altering in a physical sense; liable to change; changeable.

Species are more or less variable under the influence of external conditions, and the varieties so formed may or may not be true species. Dawson, *Nature and the Bible*, p. 134.

2. In *bot.* and *zool.*, embracing many individuals and groups (varieties, subspecies, forms, states) which depart somewhat from the strict type: said of a species or, in a similar sense, of some particular character.—3. Liable to vary or change, in a moral sense; mutable; fickle; inconstant: as, variable moods.

O, swear not by the moon, the inconstant moon,
That monthly changes in her circled orb,
Lest that thy love prove likewise variable.

Shak., *R.* and *J.*, ii. 2. 111.

Lydington was sent to Leith, where he died, and was suspected to be poisoned; a Man of the greatest Understanding in the Scottish Nation, and of an excellent Wit, but very variable; for which George Buchanan called him the Chamellion. Baker, *Chronicles*, p. 349.

4. Capable of being varied, altered, or changed; liable to change; alterable; in *gram.*, capable of inflection.

I am sure he [Milton] would have stared if told that the "number of accents" in a pentameter verse was variable. Lowell, *Among my Books*, 2d ser., p. 297.

5. In *math.*, quantitatively indeterminate, and considered with reference to the various determinations of quantity that are possible in the case. See *II.*

A quantity is said to be unrestrictedly variable in a region when it can assume all numerical values in this region. *Encyc. Brit.*, XXIV. 70.

6. In *astron.*, changing in brightness.—**Variable cut-off**, in engines, valve-gear so arranged as to cut off the steam or other elastic fluid from its cylinder at any determined point in the stroke of the piston, thus allowing the remaining effort to be accomplished by expansion of that supplied at the first part of the stroke. See *cut-off*.—**Variable gear**, in *mech.*, a form of geared wheels designed to impart alternating changes in the speed of any machine, as a slow advance and quick return in reciprocating movements. Such gears are made in the form of sectors of different radius, which are brought into action alternately as the gears revolve. Another form of variable-speed mechanism employs geared wheels of different diameters, with a broad drum for a belt, the drum being divided into different sections, and each section connected by a separate shaft or sleeve with one of the gears. By shifting the belt to different sections of the drum, variations in the speed are obtained. In other forms of variable-speed mechanism, cones and disks are used in frictional contact, the variations being ob-

tained by changing the point of contact of the two cones or disks; the common case-pulley is also a form of variable-speed mechanism. See *pulley*.—**Variable motion**, in *mech.*, motion which is produced by the action of a force which varies in intensity.—**Variable screw**.—**Variable species**, in *biol.*, any species whose variations are notably numerous or marked, or whose rate of variability is decidedly above the average. (See *def.* 2.) All species are variable, and incessantly varying; but some show less fixity of characters than others, or are just now undergoing much modification, or happen to be among those of which we possess many specimens illustrating marked departures from the assumed type-form, as subspecies, varieties, etc.; and such are the *variable species* of the naturalists' every-day language, so called by way of emphasis, not of strict definition. See, for example, *strawberry*.—**Variable-speed pulleys**, an arrangement of pulleys and gears to produce changing speeds; variable-speed wheels.—**Variable-speed wheels**, wheels combined to transmit variable motion; variable-speed pulleys.—**Variable star**, in *astron.*, a star which undergoes a periodical increase and diminution of its luster. = *Syn.* 1 and 3. Wavering, unstable, vacillating, fluctuating, fitful.

II. *n.* 1. That which is variable; that which varies, or is subject or liable to vary or change.

There are many variables among the conditions which conspire for the production of a good photograph. J. N. Lockyer.

2. In *math.*, a quantity which is indeterminate, and is considered with reference to its different possible values; originally, a quantity capable of values continuously connected in one dimension, so that it could be conceived as running through them all in the course of time. This meaning still remains; but we now speak of the position of a point as variable in two or three dimensions, and we also speak of the arguments of functions in the calculus of finite differences, where there is no approach to continuity, as variables. The difference between an indeterminate constant and a variable is frequently a mere difference of designation; but constants, though indeterminate, are not usually considered with reference to the different values which they may take. Mathematically there is very little (and no precise) difference between a variable and an unknown.

3. A shifting wind, as opposed to a trade-wind; hence, the variables, the intermediate region or belt between the northeast and the southeast trade-winds. The region varies in width from about 150 to 500 miles, and is characterized by calms, shifting breezes, and sometimes violent squalls, the laws of which are not so readily understood as are those of the trade-winds. The name is also generally given to those parts of the ocean where variable winds may be expected.

We find uniform trade-winds on each side the equator, almost uniting near it, and without a space of continuous "rains"—a limited interval only of variables and calms being found, during about ten months of the year. Fitz Roy, *Weather Book*, p. 125.

Complex variable. See *complex*.—**Dependent variable**, any variable not the independent one.—**Independent variable**, in the calculus, the variable with reference to which the differentiations are performed; the variable to which the differentiations refer; also, the variable which is considered first, or as the parameter for the others. In any problem which may be proposed, it is a mere matter of convenience what variable shall be taken as the independent one; but after the equation is constructed the matter is in many cases determinate. In partial differential equations, equations of surfaces, etc., there are two or more independent variables.

variableness (vā'ri-ā-bl-nes), *n.* The state or character of being variable. (a) In a physical sense, susceptibility of change; lability or aptness to alter or to be altered; changeableness; variability: as, the variableness of the weather. (b) In a moral sense, mutability; inconstancy; unsteadiness; fickleness; levity: as, the variableness of human emotions.

2. In *law*, a discrepancy: (a) Between pleadings and proof, as where a complaint mentions a wrong date, or the facts prove to be different from what was alleged. (b) Between the form of the writ or process by which the action was commenced and the form of the declaration or complaint. Formerly, when variances were deemed more important than now, variance was often defined as a fatal discrepancy or disagreement, etc.; but in civil cases such variances between pleading and proof as do not actually mislead the adverse party are now disregarded as immaterial, and many others are amendable. Under what is known in the United States as the Code Practice, variance is used to designate a discrepancy in some particulars only, and is amendable if it has not misled, while a failure of proof as to the entire scope and meaning of an allegation is not regarded as a mere variance, but fatal.

3. Difference that produces disagreement or controversy; dispute; dissension; discord.

A sort of poor souls met, God's fools, good master,
Have had some little variance amongst ourselves.
Fletcher, *Beggars' Bush*, li. 1.

Watts, Improvement of the Mind, I. vii. § 1.

6. In astron., any deviation from the mean orbit or mean motion of a heavenly body, occasioned by another disturbing body. When these deviations are compensated in comparatively short periods of time they are called *periodic variations*, but when the compensation requires an immense period of time for its consummation the variation is called a *secular variation*.

7. In physics and nav., the deviation of a magnetic needle from the true north, denoted by the angle which the vertical plane passing through the poles of the needle freely suspended, and undisturbed by local attraction, makes with the geographical meridian of the place: generally and more properly called *declination*. The variation of the compass does not remain constantly the same in the same place, but undergoes certain diurnal, secular, and accidental changes. Of these the diurnal changes amount to only a small fraction of a degree; the secular change, however, may amount to 20° or 30° or more, and goes through a long cycle requiring for its completion some three or four centuries. Thus, in the year 1576, in London, the variation was 11° 15' east; in 1652 the needle pointed due north, after which time it traveled about 24½° to the westward (the maximum being in 1815); the variation is now considerably less, and is continually decreasing. It is very different, however, in different parts of the globe. In the eastern part of the United States the variation is now westerly, and has been increasing since the last decade of the eighteenth century; but the annual change is now less than it was fifty years ago. In the western United States the variation is easterly, and has been in general diminishing; for a region in the extreme southwest, however, the needle is now stationary. The accidental variations are such as accompany magnetic storms, and are most frequent and violent at periods of about eleven and a half years, corresponding to the sun-spot period. See *declination*, *agonic*, *isogonic*.

The divergence of the position of the magnetic needle from the true north-and-south line is called its *declination*, or, by nautical men, its *variation*.

Huxley, Physiography, p. 10.

8. In biol., the act, process, or result of deviation from a given type of form or structure in a plastic vegetable or animal organization, by means of natural selection; or the sum of the phenomena resulting from the influence of conditions of environment, as opposed to those which would have been exhibited had the law of heredity alone been operative. See *variability*, 2, and *variety*, 6. Variation in the biological sense is the accomplishment of that which variability permits, environment requires, and selection directs; it covers the whole range of deviation from a given type, stock, or parent-form. Individual variation may be teratological, resulting in malformations or monstrosities, which are quite aside from the normal course of evolution, and probably never in perpetuity, though some freaks of nature, not decidedly pathological or morbid, are sometimes transmitted, as polydactylism in man, and the like. Another series of variations, less decidedly at variance with an ordinary development, and if not useless at least not harmful to the organism, result in numberless sports, especially of cultivated plants and domesticated animals, which tend to perpetuation or may be perpetuated artificially. (See *selection*, 3 (artificial and methodical), *sport*, n., 8, and *strain*, 2, 1.) The usual course of variation on a grand scale is believed to be by the natural selection of useful characters to be preserved and increased, with such decrease or extinction of their opposites as tends to their further improvement. The first decided steps in this direction are seen in the (mainly geographical or climatic) varieties, races, subspecies, and conspecies of ordinary descriptive zoology and botany; a step further brings us to the species; and most biologists hold that such increments of differences by insensible degrees have in fact resulted in the genus, the family, and all other distinctions which can be predicated among animals and plants. Variation is used in a more abstract sense, as nearly synonymous with *variability*: as, a theory of variation; and in a more concrete sense, like *variety*: as, this specimen is a variation of that one.

Some authors use the term *variation* in a technical sense, as implying a modification directly due to the physical conditions of life; and variations in this sense are supposed not to be inherited.

Darwin, Origin of Species, p. 25.

No two plants are indistinguishable, and no two animals are without differences. Variation is coextensive with Heredity.

H. Spencer, Prin. of Biol., § 85.

9. In music, a tune or theme repeated with changes, elaborations, or embellishments, especially when made one of a series of movements aiming to develop the capacities of a given subject. The impulse to compose sets of variations of a melody was one of the early fruits of the desire for extended works in which an artistic unity should be manifest. In the beginning of this century this impulse was doubtless indulged to excess, ingenuity of mechanical invention and the desire for executive display being unduly prominent. But essentially the idea of the repetition of a given theme with decoration and transformation is involved in the whole theory of thematic development. The particular devices used to produce variations—such as melodic figuration, alteration of harmonic structure, change of mode or tonality, change of rhythm, etc.—are too many to be enumerated. Variations were formerly called *dobles*.

10. In the calculus, an infinitesimal increment of a function, due to changes in the values of the constants, and affecting it, therefore, in different amounts for different values of the variables.—11. In alg.: (a) The following of a + sign after a — sign, or vice versa, in a row of signs. (b) A linear arrangement of some of a given set of objects or of all. Thus, there are fifteen variations of the letters A, B, C, as follows: A, B, C, AB, BA, BC, CB, CA, AC, ABC, BCA, CAB, CBA, BAC, ACB.—Analogous variation, in biol., a variation occurring in a species or variety which resembles a normal character in another and distinct species or variety; a parallel variation. Darwin, Var. of Animals and Plants.—Correlated variation, in biol., a variation in any part of one organism which is correlated with and consequent upon the variation of another part of the same organism. The idea is that the whole organization of any individual is so bound together during its growth and development that when slight variations in any one part occur, and are accumulated through natural selection, other parts become modified. Darwin, Orig. of Species, p. 146.—Function of limited variation. See *function*.—Method of concomitant variations. See *method*.—Method or calculus of variations, a branch of the differential calculus established by the Bernoullis, Euler, and Lagrange, the object of which is to solve certain problems, called *problems of isoperimetry*, in which one curve, surface, etc., is compared with another in regard to certain conditions. For example, the earliest problem of the calculus of variations was that of the brachistochrone—Given two points A and B, to find the curve along which a particle will fall in least time from A to B. A variation is denoted by a lower-case Greek delta.—Movements of variation, in physiol., movements exhibited by mobile organs in plants, generally occurring in response to an external stimulation, as in the sensitive plant.—Parallel variation, in biol., same as *analogous variation*. Darwin, Var. of Animals and Plants.—Right of variation, in canon law, the right of a lay patron during an established period to suggest, for confirmation by the proper ecclesiastical authority, the diversion of a benefice already presented to a different candidate. A right of variation by which the ecclesiastical having the appointing power is obliged to appoint the second candidate presented is called *privative*; and the right of presentation by which he may appoint at his own discretion either of the candidates presented is called *cumulative*. McClintock and Strong.—Variation of parameters, a change in an equation by which some of its constants are made functions of the variables. The application of this device to the solution of differential equations is called the *method of the variation of parameters*.—Variation of the elements, a method for the solution of a dynamical problem which differs only slightly from another whose solution is known.—Variation of the moon, an inequality in the moon's rate of motion, occasioned by the attraction of the sun, and depending as to its degree on the moon's position in her orbit, consisting in an acceleration in longitude from the quadratures to the syzygies, and a retardation from the syzygies to the quadratures. It was discovered by Tycho Brahe (1546–1601).—Variation-permanence. See *Newton's rule*, under *rule*.—Variations of state, in engraving, the results of all changes made on a plate by cutting, retouching, erasing inscriptions and substituting others, altering publisher's address, methods of printing, etc., according to which, in important engravings, the impressions are classified.

5. Something differing from others of the same general kind; one of many things which agree in their general features; a sort; a kind: as, *varieties* of rock, of wood, of land, of soil; to prefer one *variety* of cloth to another.—6. In *biol.*, with special reference to classification: (a) A subspecies; a subdivision of a species; an individual animal or plant which differs, or collectively those individuals which differ, from the rest of its or their species, in certain recognizable particulars which are transmissible, and constant to a degree, yet which are not specifically distinctive, since they intergrade with the characters of other members of the same species; a race, especially a climatic or geographical race which arises without man's interference. See *species*, 5. As the biological conception of species excludes the notion of special creation, or of any original fixation of specific distinctions, so the same conception regards varieties as simply nascent species which may or may not be established; if established, varieties have become species in the process, as soon as the steps of that process are obliterated. A variety has in itself the making of a species, and all species are supposed to have thus been made. The distinction being always in degree only, and never in kind, the actual recognition of both varieties and species for the purposes of classification, nomenclature, and description is largely a matter of tact and experience. See *trinominalism*.

(b) A race, as of cultivated plants or domestic animals; a stock; a strain; a sport; a breed; a general term, covering all the modifications which may be impressed upon animals and plants by artificial selection. See the more distinctive words, especially *race*, *n.*, 5 (b). Varieties of this grade seldom reach the permanence of those attributed to natural selection, and tend to revert if left to themselves, though the actual differences may be greater than those marking natural varieties. (See *Dysodia*.) In like manner the term *variety* is applied to inorganic substances of the same kind which are susceptible of classification, to note differences in color, structure, crystallization, and the like, all the varieties being referable to some one species which is assumed as the typically perfect standard: as, *varieties* of quartz or of diamond. See *subspecies*.—**Climatic variety**, a natural variety of any species produced by climatic influences, or specially affected by such influences, or regarded with particular reference to climate. As climate itself is largely a matter of geography, a climatic variety is almost necessarily a geographical variety, and the terms are interchangeable. See below.—**Geographical variety**, a natural variety of any species whose range of distribution is coincident with a given geographical region, and whose varietal peculiarities have been caused by, or are dependent for their perpetuity upon, local influences, especially climate; a climatic variety; a local race. Animals and plants which have a wide geographical distribution are almost always found to run into geographical races, which may be so strongly marked that there is great difference of opinion among naturalists respecting their full specific or only varietal valuation. The principal exceptions are in those forms whose individuals may be wide-ranging, through unusual powers of locomotion, as those birds which perform extensive annual migrations, and are therefore not continually subjected to modifying local influences. Geographical variation, under any given degree of climatic difference, is strongly favored by insulation, or anything which tends to a sort of natural in-and-in breeding of comparatively few individuals, as is well illustrated in the fauna and flora of islands, where geographical varieties tend to develop speedily into species distinct from those of neighboring islands. Mountain-ranges and desert areas always develop a fauna and flora of a facies peculiar to themselves. The main climatic factors in the evolution of geographical varieties are relative temperature and relative humidity.—**Variety hybrid**, a mongrel resulting from crossing individuals of opposite sexes of different varieties of the same species. They are much more numerous than hybrids between different species, and are usually very easy to bring about with proper selection of the stocks from which to breed. They are also usually fertile, which as a rule is not the case with the progeny of thoroughly distinct species.

variolite (vā'ri-ō-lit), *n.* [*variola* + *-ite*.] A rock in which there is a more or less distinctly concretionary arrangement, giving rise to pustular or pea-like forms which are disseminated through a finely crystalline ground-mass, and which, from their resemblance as seen on weathered surfaces to smallpox-pustules, have for hundreds of years made this rock an object of curiosity. In India variolite has been held in high respect as a preventive of or cure for smallpox, being worn as an amulet suspended from the neck, or used in other similar ways. The name by which it has been known there is *gammaica*. From the time of Aldrovandi till now, variolite has occupied the attention of geologists and lithologists. The best-known locality, by far, of this curious rock is the region of the river Durance, near the border of France and Italy. A rock very similar in character to the variolite of the Durance is found in the district of Olonetz in Russia. Variolite is now most generally regarded as a product of contact-metamorphism. The varioles or spherulites of this rock seem rather variable in composition, but chiefly made up of a trichlinic feldspar. The Durance variolite is defined by its latest investigators (Messrs. Cole and Gregory) as being "a devitrified spherulitic tachylite, typically coarse in structure."

The resinous substances most commonly employed for varnishes are amber, anime, copal, mastic, rosin, sandarac, and shellac, which may be colored with arnotto, asphalt, gamboge, saffron, turmeric, or dragon's-blood. The solvents are (a) fixed or volatile oils or mixtures of them (as linseed-oil or spirits of turpentine), and (b) concentrated alcohol or methylated spirits; hence the varnishes are divided into two classes, *oil-varnishes* and *spirit-varnishes*.

Spencer*, *Prin. of Psychol.*, § 2.

The machinery of circulation is two sets of vessels—the hematic, or vascular system proper, consisting of the heart, arteries, veins, and capillaries for the blood-circulation; and the lymphatic, consisting of lymph-hearts and vessels for the flow of lymph. . . . Those tissues whose capillaries are large enough for the passage of all the constituents of the blood are said to be vascular; those which only feed by sucking up certain constituents of the blood, and have no demonstrable capillaries, are called non-vascular. *Cowley*, *Key to N. vase (vās or vāz), *n.* [Formerly also *vaize*, earlier as *L.*, in the pl. *vasa*, used with added *E. pl.*, *vasa's*; = D. *vaas* = G. *vasc* = Dan. *vase* = Sw. *vas*, < F. *vasc*, OF. *vasc*, *vaze* = Sp. Pg. *vaso* = It. *vasc*, *vaso*, < L. *vas*, also *vasum* (rarely *vasus*), pl. *vasa*, neut., a vessel, also an implement or utensil, pl. equipments, baggage; cf. Skt. *vasana*, a receptacle, box, basket, jar, *vāsas*, a garment, < √ *vas*, put on, clothe (cover): see *vast* and *wear*.] Hence ult. *vessel*, *extravasate*. According to the F. pron. (vāz), and to the time when the word *vase* appears to have been taken into E. (between 1660 and 1700), the reg. E. pron. would be vāz, with a tendency to make it conform to the apparent analogy of *base*, *case*, etc.—that is, to pronounce it vās. At the same time, the recency of the word, and its association with art, have tended to encourage the attempts to pronounce it as F., namely vāz, in the 18th century absurdly rendered also as vāz, the word being found accordingly in the spelling *vaize*. In the latter part of the 18th century the word was pronounced vās by Sheridan, Scott, Kenrick, Perry, Buchanan, vāz by Walker (who says he has "uniformly heard it pronounced" so), Smith, Johnston, and vāz by Elphinston, the last pronunciation, vāz, being used, according to Walker, "sometimes by people of refinement; but this, being too refined for the general ear, is now but seldom heard" (though Ellis says (in 1874) that it is the most familiar to him). The pron. vāz, now affected by many, is a more successful attempt to imitate the present F.

pronunciation. In the 18th century the sound vā in foreign words, except before *r*, was almost always rendered ā by English speakers (cf. *spa*, often written *spau*, pron. spā, G. *ja*, written *yaw* (yā), etc.).] *1.* A hollow vessel, generally high in proportion to its horizontal diameter, and decorative in character and purpose. The term is sometimes restricted to such vessels when made without covers and without handles, or with two equal and symmetrical handles; but in the widest sense, as in speaking of Greek and other ancient vases, vessels of any form whatever are included. As a branch of art development, by far the most important production of vases was that of the ancient Greeks during

the creative period of their art history, for many centuries previous to 200 B. C. The greater part of the Greek vases are in fine pottery, unglazed, and decorated with monochrome and outline designs in simple pigments. They are notable not only for the great beauty and appropriateness of much of the decoration, but for the supreme elegance, unattained among other peoples, of a large proportion of the forms. These Greek vases were in actual use in antiquity, not only as ornaments, but as utensils for the various purposes in every-day life. See *Greek art* (under *Greek*) and *vase-painting*, and the cuts under the names of the different forms of vases, as *amphora*, *crater*, *hydria*, *oxybaphon*, *prochoos*, *stamnos*.

Hence—*2.* An object designed usually for ornament, but sometimes for other specific purposes, having somewhat the form and appearance of the vessel in the primary sense. Such vases are often made of marble, or of metal, in an antique or pseudo-antique form, and are used to hold flowers, to decorate gate-posts, monuments, and the like, or are placed on a socle or pedestal, or in a range on an architectural parapet, façade, or frontispiece. Compare cut under *ajiz*.

In the eighteenth century some clocks were made which told the time by means of two rings, set one upon another and revolving at different rates of speed, the one for the hours, the other for the minutes. vase-painting (vās'pān'ting), *n.* The decoration of vases with pigments of any kind, especially the decoration of the pottery of the ancient Greeks, which, unless exceptionally, was executed in monochrome tints and outlines in unvitriifiable pigments. It is the most important of the minor arts of ancient Greece. From the variety and domesticity of the subjects treated, Greek vase-painting is of the greatest importance for the light shed by it upon every phase of ancient life; and from the art side it is equally valuable, not only from the fine decorative and creative quality which it frequently shows, but from the information which it supplies regarding the great art of Greek painting, which has perished. The work bears something the relation to the great art that is borne by the comic and other illustrated prints to the painting of the present day. Historically, after the very ancient kindred styles of Asia Minor, the Ægean Islands, and the mainland of Greece (as at Mycenæ and Sparta), in which the rude ornament is geometric, or based on plants and animals, usually marine, with occasional admission of human figures, Greek vase-painting may be subdivided into four styles. (1) The *Dipylon* or *early Attic style*, so called because the first examples recognized were found near the Dipylon gate in Athens. The ornament is largely geometric, with bands of slim and grotesque men and animals, the design becoming freer with the advance of time. (2) The *Corinthian style*, in which the characteristic feature is the superposition of hands of animals and monsters, with rosettes and elaborate flowered and fringed borders, the whole following very closely the Assyrian and Phrygian embroideries, which were abundantly imported into Greece in this early time. (See cut under *Corinthian*.) The earliest distinctive Cypriote vases blend the characteristics of the Dipylon and Corinthian styles. (3) The *black-figured style*, which, though archaic and often rude, has become thoroughly Hellenic. The ornament is in general black on a ground of the natural color of the pottery, which is most often dull red, sometimes yellow or gray. Some details of dress, etc., are put in purplish red; the flesh of female figures is commonly painted in white; occasionally bright red, dull green, and yellow are introduced. (4) The *red-figured* or *final style*, which was developed

early in the fifth century B. C., and continued until vase-painting was practically abandoned, about 200 B. C. It embraces the period of transition from the archaic, to which belong some of the first masters among vase-painters, and is by far the most important for study. In this style a tendency toward polychromy appears occasionally, but was not consistently worked out, except in the small but admirable class of Attic funeral lecythi. In some elaborate pieces of the fourth and third centuries, chiefly Attic, gilding is sparingly introduced. The style implies the presence of figures and of ornamental designs of every kind, very commonly in bands or zones running around the vase, in which the design appears in the natural red of the clay, details being indicated in simple black lines, and the ground being covered with solid glossy black. For examples of the red-figured decoration, see cuts under *Greek* and *Poseidon*.

(*a*) In quaternions, a quantity which, being added to any point of space, gives as the sum that point which is at a certain distance in a certain direction from the first. Vectors are said to be equal when their directions and magnitudes are the same. Unit vectors in quaternions are considered as equivalent to quadrantal versors having their axes in the directions of vectors; the word *vector* has accordingly sometimes, but incorrectly, been used in the sense of a quadrantal versor. Every quaternion can be resolved in one way, and one way only, into a sum of a scalar and a vector; and this vector is called the *vector* of the quaternion, and is denoted by writing *V* before the sign of the quaternion. Thus, *Vq* denotes the vector of the quaternion *q*. vein (vái), *n.* [*< ME. veine, reyne, vayne*, *< OF. (and F.) veine* = *Sp. It. vena* = *Pg. veia*, *< L. vena*, a blood-vessel, vein, artery, also a watercourse, a vein of metal, a vein or streak of wood or stone, a row of trees, strength, a person's natural bent, etc.; prob. orig. a pipe or channel for conveying a fluid, *< vehere*, carry, convey; see *vehicle*, and cf. *veil*, from the same source.]

1. In *anat.*, one of a set of blood-vessels conveying blood from the periphery to the physiological center of the circulation; one of a set of membranous canals or tubes distributed in nearly all the tissues and organs of the body, for the purpose of carrying blood from these parts to the heart. The walls of the veins are thinner, as a rule, and more flaccid, than those of the arteries; they are composed of three layers or coats—the outer or fibrous; the middle, made up chiefly of sparse muscular fibers; and the inner or serous. The inner or lining membrane, especially in the veins of the lower extremities, presents numerous eroscentic folds, usually in man occurring in pairs, known as the *valves* of the veins, which serve to prevent a backward flow of the blood. The nutrition of the walls is provided for by the *vasa vasorum*. The nerves supplying the walls of the veins are few in number. There are two systems of veins—the systemic, or those carrying venous blood from the tissues of the body to the right auricle of the heart; and the pulmonary, or those carrying the oxygenated blood from the lungs to the left auricle of the heart. The portal system is a subdivision of the systemic, in which blood coming from the digestive organs is conducted to the liver by the portal vein, circulates throughout this organ, is again collected in the hepatic veins, and is thence carried to the right

auricle of the heart. The veins of the portal system have no valves. The blood in the systemic veins is dark-red in color, and flows in a continuous stream. The umbilical veins of the fetus, like the pulmonary veins, convey oxy-

genated or arterial blood. As a general rule, the corresponding veins and arteries run side by side, and are called by the same names. In fishes and other low vertebrates which breathe by gills, the veins from these organs correspond in function, but not morphologically, with pulmonary veins. There is a reniportal system of veins in some animals, as *Amphibia* and reptiles, by which the kidneys receive blood from veins as well as by renal arteries. See phrases below, and *vena*. See also cuts under *circulation*, *heart*, *liver*, *lung*, *mediant*, and *thorax*.

Destruction of Troy (E. E. T. S.), l. 5829.

2. Loosely, any blood-vessel. Many of the veins being superficial or subcutaneous, liable to ordinary observation, and when swollen or congested very conspicuous, the name is popularized, and extended to the arteries, while *artery* remains chiefly a technical term.

Shak., *R. and J.*, v. l. 61.

3. In *entom.*, one of the ribs or horny tubes which form the framework of the wings of an insect, and between which the thin membrane of the wings is spread and supported; a *nervure*. Veins result from certain thickenings of the upper and under surfaces of the sac which primarily composes the wing, these thickenings being exactly coapted, and often hollowed or channelled for the reception of air-tubes—which enables the wings to subservise to some extent functions of lungs. The primary veins give out veinlets or nervules. The venation of the wings differs much in different insects, but is sufficiently constant in each case to afford valuable classificatory characters. See cuts under *Chrysopa*, *Cirrophanus*, *nervure*, and *venation*.

4. In *bot.*, a fibrovascular bundle at or near the surface of a leaf, sepal, petal, etc.: same as *nerve*, 7. See *nerivation*.—5. In *mining*, an occurrence of ore, usually disseminated through a gangue or veinstone, and having a more or less regular development in length, width, and depth. A *fissure-vein*, or *true vein*, is a vein in which the ore and veinstone occupy a preexisting fissure or crack in the rocks, which has been formed by some deep-seated cause or crust-movement, and may therefore be presumed to extend downward indefinitely, and for the same reason is likely to have considerable development in length. True veins usually have well-defined walls, on which there is more or less flitcan or gouge, and which are often striated or polished, giving rise to what miners call *stickensides*. True veins often have the ore and veinstone arranged in parallel plates or layers, called *combs*. Experience shows that true veins are more to be depended on for permanence in depth than other more irregular deposits, although the latter are often highly productive for a time. A vein and a lode are, in common usage, essentially the same thing, the former being rather the scientific, the latter the miner's, name for it. The term *deposit*, when used by itself, means an irregular occurrence of ore, such as a flat-mass, stock, contact deposit, carbona, and the like; but when to *deposits* the term *ore* or *metalliferous* is prefixed (*ore-deposits*, *metalliferous deposits*), the designation becomes the most general one possible, including every form of occurrence of the metalliferous ores, and having the same meaning as the French *gîtes métallifères* and the German *Erzlagertöten*. A bed of rock forming a member of a stratified formation, with which it was synchronously deposited, cannot properly be called a vein or lode, even if it has metalliferous matter generally disseminated through it in quantity sufficient to be worth working, as is the case with the cupriferos slate (*Kupferschiefer*) of Mansfeld in Prussia, or when it is concentrated in pipes or pipe-like masses, occurring here and there in the stratum, as in the silver-lead mines of Eureka in Nevada. (See *ore-deposit*.) Further—(a) for forms of ore deposits which are not true veins, but which are designated by the name *vein*, see *gash-vein*, *segregated vein* (also *vein-vein*), *pipe-vein*; (b) for forms qualified, according to general usage, by the name *deposit* (which also see), and which are still further removed from the class of true veins than those previously noted; see *contact deposit* (under *contact*), *blanket-deposit*; (c) for other still more irregular forms of ore-deposit, which have special names, and which, while not themselves properly designated as veins, are frequently more or less closely connected with true veins, occurring in close proximity, and forming a kind of appendage, to them, see *flat*, 10, *pipe*, 16, *carbona*, *impregnation*, 4; and (d) for German mining terms applied to various irregular forms of ore-deposit, not true veins, which terms are often used by scientific writers in English in describing

mining regions or in discussing the general mode of occurrence of the metalliferous ores, see *stock*, 32, *stockwork*, *fahband*. See also *lode*, 3, *leader*, 5 (a); also *rake vein*, a term applied in Derbyshire, England, to true veins to distinguish them from the flats and pipe-veins with which they are closely connected.

Though even in nature there may be many good inclinations to many instances of the Divine commandments, yet it can go no further than this *velleity*, this desiring to do good, but is not able.

Jer. Taylor, *Works* (ed. 1835), II. 12.

Velleity—the term used to signify the lowest degree of desire, and that which is next to none at all, when there is so little uneasiness in the absence of any thing that it carries a man no farther than some faint wishes for it.

There are from 30 to 40 species, natives of tropical and southern Africa, Madagascar, and Brazil. They are erect perennials, with a fibrous and usually dichotomous stem densely clothed with the projecting or imbricating bases of fallen leaves, and commonly arborescent. The rigid linear leaves are crowded at the ends of the branches; they are short and strict, or elongated and often pungent-pointed. The flowers are commonly handsome, white, sulphur-yellow, violet, or blue, and are solitary or two or three together within a cluster of leaves; the perianth is bell-shaped or funnelform, with equal ovate-oblong or long-stalked distinct segments. The fruit is a globose-oblong or three-angled capsule, sometimes roughened or echinate. The plant is known as *tree-lily*, the flowers resembling lilies. The heavy branching trunk, from 2 to 10 feet high, is often as thick as a man's body; its leaves, tufted at the top, suggest those of the yucca. They impart the characteristic aspect to some of the mountainous districts of Brazil.

Velloziæ (vê-lô'zî'ê-ê), *n. pl.* [*NL. (Don, 1830), < Vellozia + -æ.*] A tribe of monocotyledo-

It includes about 58 species, classed in the 2 genera *Vellozia* and *Barbacenia*, the latter entirely South American and the same in habit as *Vellozia*.

The name is applied to a large number of instruments, ranging from a ship's log to an electroballistic apparatus, and including the speed-gage and speed-recorder for machinery.

2. Specifically, an instrument for measuring the initial velocity of a projectile.

velocipede (vê-lo's'i-pêd), *n.* [= F. *vélocipède*; < L. *velox* (*veloc*-), swift, + *pes* (*ped*-), foot.] A light vehicle or carriage, with two wheels or three, impelled by the rider. One of the older forms of this carriage consisted of two wheels of nearly equal size, placed one before the other, and connected by a beam on which the driver's seat was fixed. The rider, sitting astride the machine, propelled it by the alternate thrust

of each foot on the ground. This form dates from the early part of the nineteenth century. Later, treadles operating cranks on the axle of the front wheel came into use, and many modified and improved kinds have become popular under the name of *bicycle*. (See also *tricycle*.) Light boats driven by a paddle-wheel or wheels operated by cranks and treadles, and known as *water-velocipedes*, have also been brought into use. See also cuts under *bicycle* and *tricycle*.

velocity (vê-lo's'i-ti), *n.*; pl. *velocities* (-tiz). [< OF. *velocité*, F. *vélocité* = Sp. *velocidad* = Pg. *velocidade* = It. *velocità*, < L. *velocitas* (-tis), swiftness, speed, < *velox* (*veloc*-), swift, akin to *volare*, fly; see *volant*.] 1. Quickness of motion; speed in movement; swiftness; rapidity; celerity; used only (or chiefly) of inanimate objects. See def. 2.—2. In *physics*, rate of motion; the rate at which a body changes its position in space; the rate of change of position of a point per unit of time. The velocity of a body is *uniform* when it passes through equal spaces in equal times, and it is *variable* when the spaces passed through in equal times are unequal. The velocity of a body is *accelerated* when it passes constantly through a greater space in equal successive portions of time, as is the case with falling bodies under the action of gravity, and it is *retarded*

when a less space is passed through in each successive portion of time. When the motion of a body is uniform its velocity is measured by the space described by it in a unit of time, as one second. If the motion of the body is not uniform its velocity is measured by the space which it would describe uniformly in a given time if the motion became and continued uniform from that instant of time.

The cool and heavy water of the polar basin, coming out in under currents, would flow equatorially with equal (almost mill-tail) velocity.

M. F. Maury, *Phys. Geography of the Sea*, § 437.

See *resolution*.—**Terminal velocity**. See *terminal*.—**Velocity diagram, function, potential**. See *diagram*, etc.—**Virtual velocity**. See *virtual*.—**Syn. 1.** *Celerity, Swift-ness*, etc. See *quickness*.

2. In *bot.*: (a) In *Hymenomyces*, a special membranous envelop which ineloses for a time the whole or a part of the sporophore. When it extends as a horizontal membrane from the margin of the pileus to the stipe, it is called a *velum parziale* or *marginal veil*. It is ruptured by the expanding pileus, when it forms the annulus or ring on the stipe. When the velum is a sac which ineloses the whole of the sporophore, it is called a *velum universale*, or *volva*. It is ultimately ruptured at the apex by the expansion of the cap. (b) In *Isobetes*, the outgrown membranous margin of the fovea. Also called *involutum*.—3. In *Mollusca*, the highly characteristic ciliated formation of the embryo, which serves as an organ of locomotion in that stage when the embryo is called a *veliger*. It is usually soon lost, but in some cases is permanently retained in a modified form. See cuts under *veliger*.—4. In *Hydrozoa*, a kind of flap or circular free edge which projects inward around the margin of the disk of many hydrozoans, as those which are bell-shaped or conical, and which from its presence are called *craspedote*; a velarium. The velum is present in all well-developed hydromedusans, but seldom in siphonomedusans, in which latter it is known as the *pseudovelum*. See cuts under *Diphyidæ* and *medusiform*.

—**Velum pendulum, velum palati, velum palatinum**, the veil or curtain of the palate; the soft or pendulous palate, especially its posterior part, in many animals prolonged into a pendant teat-like process, the uvula. (See cut under *tonsil*.) In cetaceans the velum forms a muscular canal which prolongs the posterior nares to the larynx, which it embraces, an arrangement bearing relation to the spouting of a whale.—**Velum terminale**, the terminal lamina of the brain; the anterior boundary of the general ventricular cavity of the brain, or front wall of the third ventricle, from the pituitary to the pineal

body. In the embryo, before the cerebral and olfactory lobes extend forward, it is the front of the anterior cerebral vesicle, and therefore the anterior termination of the cerebellum axis. Also called *terma*, and *lamina terminalis*.—**Velum triangulare**. Same as *velum interpositum*.

A closely woven silk stuff having a very thick and short pile on one side, which is formed by carrying part of the warp-thread over a needle, and cutting the loops afterward. Inferior kinds are made with a cotton back (see *velveret*), and are commonly called *cotton-backed velvets*. Cotton velvets are also made. (See *cotton*), and also *velveteen*.) These imitations and inferior qualities are so common that real velvet is commonly called *silk velvet* or *Lyons velvet* to distinguish it from them.

2. The covering of a growing antler, consisting of the modified periosteum peculiar to antlers, with cuticle and fur. It bears the same relation to the nutrition of the antler that periosteum does to that of bone. Its sloughing or exuviation follows the constriction and final obliteration of its vessels—a process which is accomplished or favored by the growth of the burr about the base of the antler, which cuts off or obstructs the circulation of blood. The antler subsequently receives no nourishment, and is itself shortly afterward exuviated or cast as a foreign body.

Good antlers "in the velvet" will sell readily for four dollars a pound in any part of Siberia.

The Century, XXXVII, 646.

From *L. venus* are ult. *E. vend*!, etc.] 1. = *Syn. Venal, Mercenary, Hireling*. These words represent a person or thing as ready to be dishonorably employed for pay. Each is strongest in one sense. *Venal* is strongest in expressing the idea of complete sale to a purchaser—character, honor, principle, and even individuality being surrendered for value received, the *venal* man doing whatever his purchaser directs, a *venal* press advocating whatever it is told to advocate. *Mercenary* is strongest in expressing rapacity, or greed for gain, and activity. *Hireling* is strongest in expressing servility and consequent contempt, *hire* having become an ignoble word for pay; as, a *hireling* soldier; a *hireling* defamer. A *venal* man sells his political or other support; a *mercenary* man sells his work, being chiefly anxious to get as much pay as possible; a *hireling* will do mean or base work as long as he is sure of his pay. *Venal* means a being ready to sell one's principles, whether he makes out to sell them or not; *mercenary* and *hireling* suggest more of actual employment.

The practice exists, although to a more limited extent, in Sicily, Sardinia, Calabria, Afghanistan, etc., and in certain rude and remote districts of the United States.

The various forms of private vengeance which have become common in this country are in many respects allied to Italian *vendetta* as it existed and may to some extent still exist in Corsica and Calabria, and with modifications in Naples, where, as has been said, "It is reduced to rule and recognized by public opinion."

To overlay or face, as an inferior wood, with wood of a finer or more beautiful kind, so as to give the whole the appearance of being made of the more valuable material; cover with veneers: as, to *veneer* a wardrobe or other article of furniture.

The Italians call it [marquetry] *pietre commesse*, a sort of inlaying with stones, analogous to the *finering* of cabinets in wood. *Smollett*, *Travels*, xxviii.

veneer (vē-nēr'), *n.* [*< veneer*, *v.*] 1. A thin piece of wood of a choice kind laid upon another of a more common sort, so as to give a superior and more valuable appearance to the article so treated, as a piece of furniture. Choice and beautiful kinds of hard woods, as mahogany or rosewood, are used for veneers, the wood to which they are attached by gluing being usually deal or pine. Ivory, mother-of-pearl, and other ornamental substances are sometimes used as veneers for small articles, as cabinets or caskets.

2. A thin coating covering the body of anything, especially for decorative purposes: used when the material of the outer coating is similar to that of the body, as in ceramics or in paper-manufacturing. [Rare.]—3. Show; superficial ornament; meretricious disguise.

Such machines employ a flexible pressure with adjustable tension, and are designed with a view to avoid splitting the material.

Veneer-cutter (vē-nēr'kut'ēr), *n.* A machine for cutting veneers from the log or block of wood; a veneer-cutting machine. Two systems are used in these machines: in one the log of wood is rotated before a long, thin knife fixed in the machine, the revolution shaving off a thin veneer of the entire length of the log, the log being gradually advanced to the knife until completely cut up; in the other system the knife-blade moves as a slicer over the block of wood or ivory. Still another method is to use a fixed knife, and to draw a square block of wood over the edge of the knife. Both circular and reciprocating saws are also used to make thick veneers. See *veneer-saw*.

Venetian architecture, **Venetian Gothic**, the style of medieval architecture elaborated in Venice between the twelfth and the early part of the sixteenth century. It combines in many respects the qualities of the arts of Byzantium, of the Italian mainland, and of transalpine Europe, but blends all these into a new style of high decorative quality and originality. The principal characteristics of this style are as follows: each story is usually graced with its own arched range of columns or pilasters, forming an open balcony or loggia, and separated from the other stories by conspicuous friezes or belts, often in the form of graceful balustrades; the arched windows are ornamented with small shafts at the sides, and their spandrels are often filled with rich carving; ornamental parapets are common; and the window-heads frequently show plain or pierced cusps of bold yet delicate outline and curves of great refinement. The most splendid example of the style is the famous Ducal Palace. Like all Italian Pointed architecture—the so-called *Italian Gothic*—the merits of the style lie chiefly in external design; the Italians never sought to master the admirable theory of arched and vaulted construction securing stability by balance of opposed pressures, which was elaborated by northern medieval architects, and raises their architecture to the highest place in the history of the art. Venetian architecture is noteworthy for its lavish use of color derived from inlaid marbles, porphyries, and other stones of rich hue, as well as of gilding and brilliant mosaic and painted decoration. It bears witness in many subtle details to the close intercourse of the Venetians with the Orient.—**Venetian ball**. See *ball*.—**Venetian bar**, needlework in imitation of heavy lace by buttonhole-stitches around a thread, producing a series of bars or bands across an open space. *Diet. of Needlework*.—**Venetian blind**, a blind made of slats of wood so connected as to overlap one another when closed, and to show a series of open spaces for the admission of light and air when opened. The term is applied especially to a hanging blind of which the slats are held together by strips of webbing or other flexible material. The pulling of a cord lifts the whole blind, the slats coming in contact with one another as they rise until all are packed closely together above the window. The pulling of another cord when the blind is down turns the slats to open or close them. In the British islands outside slated shutters are also so called.—**Venetian carpet**. See *carpet*.—**Venetian chalk**. Same as *French chalk* (which see, under *chalk*).—**Venetian embroidery**, embroidery upon linen and similar materials, done by cutting away a great deal of the background so as to produce an open design like coarse lace, the edges of the stuff forming the pattern being stitched, and bars or brides sometimes used to steady and support the smaller leaves, etc.—**Venetian enamel**, an enamel used for clock- and watch-dials.—**Venetian glass**. It was above all a school of colorists; in the magnificence of its use of pigments and in technical perfection it has never been surpassed; and in every artistic quality its chief masters will always rank with the first painters of the world.—**Venetian sumac**. See *sumac*.—**Venetian swell** in *organ-building*, a swell, or set of blinds, made after the pattern of Venetian blinds. See *swell*.—**Venetian turpentine**.

2. The poisonous fluid secreted by some animals in a state of health, as a means of offense and defense, and introduced into the bodies of their victims by biting, as in the case of many serpents, or stinging, as in the case of scorpions, etc. In vertebrates venom is usually a modified saliva secreted by glands morphologically identical with ordinary salivary glands; and the normal saliva of various animals acquires at times, or under some circumstances, an extremely venomous quality, as in the rabies of various beasts. Venom is normal to few vertebrates, notably all thanatophidian serpents, and one or two lizards, as the Gila monster. Venom-glands are connected with the spines of the head or fins of a few fishes. Venom of extreme virulence is injected with the bite of a few spiders (see *Latrodeus*, and cut under *spider*), and the punctures made by the claws or telson of centipeds and scorpions are envenomed. An acrid or irritating fluid, classable as venom, is injected with the sting of many insects (see cases cited under *sting*), and in one case at least may be fatal to large animals (see *factæ*).

Such a fang is firmly attached to the maxillary bone, and may be thrown forward or laid flat by a peculiar mechanism by which the bones of the upper jaw change their relative position. Such a tooth is either grooved (as in *Proteroglyphia*) or so folded upon itself as to form a tube (as in *Solenoglyphia*) for the conveyance of venom, being also connected with the duct of the receptacle which contains the fluid. The mechanism of the bones is such that opening the mouth widely causes erection of the venom-fang, while the forcible closure of the mouth upon the object bitten causes the injection of the venom into the wound by muscular pressure upon the venom-sac. Venom-fangs are a single pair or several pairs. Also called *poison-tooth*. See cuts under *Crotalus* and *viper*.

The third ventricle lies between the optic thalami. It communicates with the fourth ventricle through the aqueduct of Sylvius. The fourth ventricle lies between the cerebellum and the pons and medulla. The so-called fifth ventricle, or

pseudocoel, has no connection with the other cerebral ventricles, being of a different nature and simply a small interval between the right and left layers of the septum lucidum. The cerebral ventricles or cælia have lately been systematically named in a morphological vocabulary which is irrespective of the peculiarities of the human brain, and based on the encephalomeræ of vertebrates. See *Aula, 2, cælia, diacælia, encephalocæle, epicaelia, mesocælia, metacælia, metepicaelia, proacælia, rhinocælia*, and cuts under *encephalon, Rana*, and *Petromyzontidæ*.—**Ventricles of the heart**, the two chambers in the heart which receive the blood from the auricles and propel it into the arteries. The right ventricle forces the venous blood coming from the right auricle into the pulmonary artery, and thence through the lungs. The left ventricle receives the arterial blood from the left auricle and propels it through the aorta and the rest of the systemic arterial system. See cuts under *heart, lung, Polyplacophora*, and *Lamellibranchiata*.

ventrioloquism (ven-tril'ō-kwiz-m), *n.* [*< ventrioloqu-y + -ism.*] The act, art, or practice of speaking or uttering sounds in such a manner that the voice appears to come, not from the person speaking, but from a distance, as from the opposite side of the room or from the cellar. Ventriloquism differs from ordinary speaking mainly in the mode of respiration. A very full inspiration is taken, which is breathed out slowly and gradually, the sound of the voice being dexterously modified and diminished by the muscles of the larynx and the palate. At the same time the lips of the performer are scarcely moved, and the deception is still further facilitated by the attention of the auditors being directed to the pretended source of the voice. Ventriloquism was known to the ancient Greeks as well as to the Romans.

What is called *ventrioloquism*, . . . and is not uncommonly ascribed to a mysterious power of producing voice somewhere else than in the larynx, depends entirely upon the accuracy with which the performer can simulate sounds of a particular character, and upon the skill with which he can suggest a belief in the existence of the causes of these sounds. Thus, if the ventrioloquist desire to create the belief that a voice issues from the bowels of the earth, he imitates, with great accuracy, the tones of such a half-stifled voice, and suggests the existence of some one uttering it by directing his answers and gestures towards the ground. The gestures and tones are such as would be produced by a given cause; and, no other cause being apparent, the mind of the bystander insensibly judges the suggested cause to exist. *Huxley.*

AS. *winnan*, strive for: see *win*.] 1. In *Rom. myth.*, the goddess of beauty and love, more especially sensual love. *Venus* was of little importance as a Roman goddess until, at a comparatively late period, she was identified with the Greek *Aphrodite*. She is represented as the highest ideal of female beauty, and was naturally a favorite subject with poets and artists, some of her statues being among the noblest remains of classical sculpture. The following are some of the more important of the innumerable surviving antique statues of this goddess. The *Venus of Arles*, a fine Greek statue found in 1651 in the ancient theater at Arles, and now in the Louvre Museum. The figure is undraped to below the waist. The hands and forearms are modern restorations. The statue probably belonged to the *Victrix* type (for this and other types, see the phrases). The *Venus of Capua*, a very noteworthy antique in the Museum of Naples, discovered in the amphitheater at Capua. The figure is undraped to the hips, and is of the *Victrix* type. It bears a strong resemblance to the *Venus of Melos*, but is distinctly inferior to that masterpiece. The head is encircled by a stephane. The *Venus of Medici*, one of the best-known works of ancient sculpture, treasured in the Uffizi Gallery at Florence. The figure is of Parian marble, wholly undraped, the face turned to one side, one of the arms extended with the hand held before the body, and the other arm bent before the breast. It is shown by the dolphin on the base to belong to the type of the *Venus Anadyomene*. While the pose is not identical with that of the *Venus of Cnidus*, it is generally held to be a free rendering of that conception. The figure is somewhat under natural size, being about 4 feet 8 inches in height, but is commonly taken as the exemplar of perfect proportions in a woman. It was found in the Villa of Hadrian, at Tivoli, about 1680. The *Venus of Melos* (by corruption from the native Greek pronunciation, *Venus of Milo*), one of the most splendid surviving works of ancient art, discovered by a farmer in the

island of Melos in 1820, and now the chief treasure of the Louvre Museum. The statue dates from about the middle of the fourth century B. C. It is undraped to the hips;

1. The Venus of Medici, in the Uffizi Gallery, Florence.
2. The Venus of Melos, in the Louvre Museum.

the arms are broken off; the figure and face are at once graceful and beautiful, and highly imposing. The type is that of the *Victrix*. The *Venus of the Capitol*, in the Capitoline Museum at Rome, undraped, and in attitude and motive very similar to the *Venus of Medici*, though the Capitoline statue displays a more personal element, and comes closer to the living model. Of the modern statues representing *Venus*, there may be mentioned the *Venus Borghese*, a celebrated statue by Canova, in the Villa Borghese at Rome. The statue represents the Princess Pauline (Bonaparte) Borghese in the character of *Venus Genetrix*. The figure is shown reclining, extending the apple in one hand, the head being a close portrait. See *Aphrodite*.

2. The most brilliant of the planets, being frequently visible to the naked eye by daylight. It is the second from the sun and next within the earth's orbit, performing its sidereal revolution in 224,7008 days; its distance from the sun is 0.723332 that of the earth; the synodical revolution is made in 584 days. Its orbit is the most nearly circular of those of the major planets, the greatest equation of the center being only 47' 3". The inclination of the orbit to the ecliptic is 3° 23' 5", and the earth passes through the ascending node on December 7th. The mass of *Venus* (which is not very closely ascertained) is about $\frac{1}{4}$ that of the sun, or $\frac{1}{11}$ that of the earth. Its diameter is a little smaller than that of our planet, which subtends an angle of $2 \times 8''$, 827 at the sun's center, while *Venus* at the same distance has a semidiameter of $8''.68$ by the mean of the best night measures, or $8''.40$ according to the observations at its transit over the sun. Taking the mean of these (which arc affected in opposite ways by irradiation), we find the diameter of *Venus* about $\frac{3}{8}$ that of the earth. Its volume is about $\frac{1}{8}$, its density about $\frac{5}{8}$, and gravity at its surface about $\frac{9}{10}$ the same quantities for the earth. It receives 1.9 as much light and heat from the sun as we, and the tidal action of the latter is about 5.3 times as great as upon the earth. The period of rotation of *Venus* is set down in many books as 23 hours and 50 minutes; but recent observations have led some astronomers to the confident conclusion that the true period falls short but a little of 225 days, so that day and night last for many years. The old figure was deduced chiefly from the observation that a spot appeared nearly in the same place night after night, so that it seemed as if *Venus* had made one complete revolution; whereas it now appears that there is in one day no sensible motion. The vast tidal action may account for the near approach of the periods of rotation and revolution. *Venus* has an atmosphere nearly twice as dense as our own, and we may safely infer that all its water is in the form of dry steam; for the dense atmosphere must cause a greater proportion of the heat to be retained. Probably nearly all the carbon is in the form of carbonic anhydride or carbonates, leaving little or no free oxygen. Geological erosion can hardly be great. The mountains of *Venus* are shown to be high by the form of the terminator. Still, *Venus* reflects a great amount of light (its albedo being 0.9 that of Jupiter, which is perhaps self-luminous), and much of this appears to come from general specular reflection, as from polished level surfaces, possibly melted metals. The night side of *Venus*, which must be intensely cold, shows a faint coppery-red light, which is somewhat fitful in its appearances, and is probably of the nature of an intense aurora. No satellite of *Venus* has ever been seen. Numerous observations of one were reported in the eighteenth century; but all these have been fairly shown to be fixed stars, except one, which was probably an asteroid. The symbol for *Venus* is ♀, supposed to represent the goddess's mirror.

The most admired example is in the Museo Pio Clementino in the Vatican.—**Venus Anadyomene** (marine *Venus*, or *Venus of the Sea*), *Venus* represented as born or rising from the foam of the sea. In art the type has marine attributes, as the dolphin, and is represented undraped. The *Venus of Medici* is an example.—**Venus Callipyge** or **Kallipygos**, a type wrongly attributed to *Venus*, the subject represented being essentially mortal. One of the best-known statues of this type is in the Museum at Naples.—**Venus Genetrix**, in *art*, etc., *Venus* as the goddess of fecundity. The type presents the goddess undraped, partially draped, or clad in a diaphanous Ionic tunic, with one hand raising the drapery toward her face from the shoulder according to the conventional Greek gesture of marriage, and with the other extending an apple.—**Venus of Cnidus**, the undraped type of *Venus* created by Praxiteles, and dedicated in the temple in Cnidus, paralleled with the draped type of the same master, that of Cos. According to tradition, the beautiful Phryne was the model for this statue. The most instructive copies accessible are one in the Vatican (as exhibited, partly masked by painted drapery of tin), and one in the Glyptothek at Munich. The *Venus of Medici* is generally held to be a free copy of this type. See cut under *Aphrodite*.—**Venus of the rock**, in *conch.*, a boring bivalve mollusk of the genus *Venerupis*. It bears a golden-yellow fruit of the size of a nutmeg, resembling a lime.—**Venus's hair**, a delicate little fern, *Adiantum Capillus-Veneris*: so called from the blackish, shining capillary branches of the rachis. It has ovate-lanceolate bipinnate fronds, or the upper part simply pinnate, with pinnules and upper pinnae wedge-shaped or rhomboid, long-stalked, the upper margin rounded, and more or less incised or crenate. It is cosmopolitan in distribution.—**Venus's hair-stones**, *Venus's pencils*, fanciful names applied to rock-crystals including slender hair-like or needle-like crystals of hornblende, asbestos, oxid of iron, rutile, oxid of manganese, etc.—**Venus's looking-glass**, a plant of the genus *Specularia*, primarily *S. speculum*.—**Venus's shells**. See *sumac*, and cut under *smoke-tree*.—**Venus Urania**, or **Celestial Venus**, *Venus* as the goddess of divine love, or of love in its abstract and spiritual phase. She is a goddess of noble and majestic type, akin to that of *Venus Victrix*, and approaching the conception of Juno.—**Venus Victrix**, *Venus* victorious, or in the character of a goddess of victory. This type appears associated with the war-god Mars, and is illustrated notably on Roman imperial coins. The goddess is represented with arms and other attributes of war.—**Venus with the Apple**. See *Venus Genetrix*.—**Warty venus**, a bivalve mollusk, *Venus verrucosa*. The valves have concentric ridges opening backward, and toward the sides or ends becoming coarser and forming knots or tubercles (whence the name). These are diversified by fine ribs or furrows radiating from the beaks. The mollusk is common along the European coasts, and chiefly affects rocky bottoms about low-water mark, but is also found on sand-banks. It is extensively used as food, and has been made the object of a special culture in France.

Veratrea (vĕ-rā'trĕ-ĕ), *n. pl.* [*NL. (Salisbury, 1812)*, < *Veratrum* + *-ea*.] A tribe of liliaceous, sometimes bulbous, plants, characterized by a tall leafy stem, or with most of the leaves radical, and by panicle or racemed and chiefly polygamous flowers with confluent and finally orbicular-peltate anther-cells. The 33 species are classed in 6 genera, of which *Scheuchzeria*, *Amianthus*, *Melanthium*, and *Zygadenus* are confined to America; the others, *Stenanthium* and *Veratrum* (the type), occur also in the north of the Old World. They bear purple, greenish, or white flowers, followed by septicidal capsules.

veratric (vĕ-rā'trik), *a.* [*F. veratrum* (*um*) + *-ic*.] Of or pertaining to veratrine or the genus *Veratrum*.—**Veratric acid**, $C_{12}H_{16}O_4$, the acid with which veratrine exists combined in *Scheuchzeria officinale*. It

crystallizes in short white transparent prisms, which are soluble in water and alcohol, and forms crystallizable salts with the alkalis, which are called *veratrates*. It has sometimes been called *cevadie*, *cevadille*, or *sabadille acid*.

veratrine (vĕ-rā'trin), *n.* [*F. veratrum* (*um*) + *-ine* 2.] An alkaloid, or a mixture of alkaloids, derived from several species of *Veratrum* and from *cevadilla*. Veratrum (vĕ-rā'trum), *n.* [*NL. (Tournefort, 1700*; earlier by *Lobel, 1576)*, < *L. veratrum*, *hellebore*.] A genus of liliaceous plants, type of the tribe *Veratee*. It is characterized by stems clad with numerous broad plicate leaves contracted into a sheathing base. There are 9 species, four of which are natives of Europe and Siberia, the others of North America. They are tall, erect, robust perennials, growing from a thick rootstock with somewhat fleshy fascicled root-fibers. The flowers are purplish, green, or white, very abundant, in a terminal panicle, and followed by erect or reflexed capsules separated into three carpels. The species are known in general as *white hellebore*, especially *V. album* and *V. nigrum* of Europe, and *V. viride* of North America, species respectively with whitish, blackish, and green flowers; their rootstocks are powerfully emetic and cathartic, and are collected in quantities for medicinal use.—*V. album* in Germany, and *V. viride* in North Carolina. Both are very acrib, occasioning excessive irritation of the digestive tract. *V. album* has also been known as *lingwort*, and, from its effect as an emetic, as *sneezewort*; it is chiefly subalpine, and occurs from Europe to Japan; its roots furnish the alkaloids veratrine, jervine, rubijervine, and others, also *cevadie acid*. A poisonous gray powder prepared from it is used to destroy caterpillars; the fresh leaves are, however, freely eaten by slugs and snails. *V. viride*, the principal American species, known also as *Indian poke*, and locally as *itchweed*, *pokebane*, and *earth-nail*, is widely distributed in and near mountain regions from Georgia into Canada and from Oregon to Sitka, is a coarse herb from 3 to 7 feet high, with numerous conspicuously ribbed and plaited ample leaves, which are ovate, pointed, and clasping. The whole plant is a nearly uniform deep green, including the conspicuous flowers, which form a pyramidal inflorescence sometimes over a foot long. Its thick, fleshy rootstock is sharp and bitter in taste, was used as an emetic by the Indians, and is also now in local use as a cardiac, and in fevers as a sedative. Many other species have conspicuous and peculiar flowers: they are green in *V. parviflorum* of North Carolina, greenish-purple in *V. Woodii* (the Indiana pokeweed), green and white in *V. Californicum*, dark-brown with the outside hoary in *V. intermedium* of Florida; in *V. fimbriatum*, of the Mendocino plains, they are fringed and spotted.

verb (vĕrb), *n.* [*F. verbe* = *Sp. Pg. It. verbo*, < *L. verbum*, a word, language, a verb, = *E. word*, *q. v.*] 1. A word; a vocable.

That so it might appear, that the assistance of the Spirit, promised to the church, was not a vain thing, or a mere *verb*.
South, *Sermons*, IX. v.

2. In *gram.*, a word that asserts or declares; that part of speech of which the office is predication, and which, either alone or with various modifiers or adjuncts, combines with a subject to make a sentence. Predication is the essential function of a verb, and this function is all that makes a verb; that distinctions of tense and mode and person should be involved in a verb-form, as is the case in the languages of our family and in some other languages, is unessential, and those distinctions may be and are sometimes wanting. Infinitives and participles are not verbs, but only verbal nouns and adjectives, sharing in the constructions that belong to a verb. In languages like ours, the most important classification of verbs is into transitive and intransitive; and even that is not definite, nor founded on any essential distinction. Abbreviated *v.*—**Auxiliary, contract, deponent verb**. See the adjectives.—**Irregular verb**, a verb not regular: in English including not only cases like *sing, sung, sung* (usually called *strong verbs*), but such as *lead, led, put, put; work, wrought*.—**Liquid, personal, reflexive verb**. See the adjectives.—**Regular verb**, a verb inflected after the most usual model: in English, by addition of *-ed* or *-d* in preterit and past participle: as,

seat, seated; pile, piled.—**Strong, weak verb**. See the adjectives.

verbal (vĕr'bal), *a. and n.* [*F. verbal* = *Sp. Pg. verbal* = *It. verbale*, < *L. verbalis*, consisting of words, < *L. verbum*, a word, verb; see *verb*.] 1. *a.* 1. Of, pertaining to, or consisting in words.

Cicero the orator complained of Socrates and his school that he was the first that separated philosophy and rhetoric; whereupon rhetoric became an empty and *verbal* art.
Bacon, *Advancement of Learning*, ii.

It is obvious enough that, unless the lower animals have some substitute for *verbal* symbols, as yet undiscovered by us, they are incapable of general ideas and of any mental processes involving these.

J. Sully, *Sensation and Intuition*, p. 16.
The future progress of our speech, it may be hoped, will bring back to us many a *verbal* Rip Van Winkle.

G. P. Marsh, *Lects. on Eng. Lang.*, xii.

2. Relating to or concerned with words only.
If slight and *verbal* differences in copies be a good argument against the genuineness of a writing, we have no genuine writing of any ancient author at this day.

Abp. Sharp, *Works*, II. iii.
Of those scholars who have disdained to confine themselves to *verbal* criticism few have been successful.
Macaulay, *Athenian Orators*.

A *verbal* dispute.
Whately.

3. Expressed in spoken words; spoken; not written; oral: as, a *verbal* contract; *verbal* testimony.

Made she no *verbal* question? *Shak.*, *Lear*, iv. 3. 26.

4. Minutely exact in words; attending to words only; insistent about words.

You put me to forget a lady's manners,
By being so *verbal*. *Shak.*, *Cymbeline*, ii. 3. 111.

5. Literal; having word answering to word; word for word: as, a *verbal* translation.

Make *verbal* repetition of her moans.
Shak., *Venus and Adonis*, l. 831.

6. Of or pertaining to a verb; derived from a verb and sharing in its senses and constructions: as, a *verbal* noun.

A person is the special difference of a *verbal* number.
B. Jouson, *English Grammar*, l. 16.

In its attributive use, finally, the participle throws off its *verbal* power and approximates an adjective, as in *Ver-nante silva cæremus*.
Amer. Jour. Philol., X. 317.

Verbal amnesia, the loss of all knowledge of the relation between words and things; complete aphasia.—**Verbal contract**. See *contract*.—**Verbal definition**, a definition intended to state the precise meaning of a word or phrase according to usage, but not to state the essential characters of a form according to the nature of things.—**Verbal degradation**. See *degradation*, I (a).—**Verbal inspiration**. See *inspiration*, 3.—**Verbal note**, in *diplomacy*, an unsigned memorandum or note when an affair has continued for a long time without any reply. It is designed to show that the matter is not urgent, but that at the same time it has not been overlooked. *Encyc. Diet.*—**Verbal noun**. See II.—**Syn. 1-5. Verbal, Oral, Literal**. *Verbal* is much used for *oral*: as, a *verbal* message; and sometimes for *literal*: as, a *verbal* translation. It is an old and proper rule of rhetoric (Campbell, *bk. 2, ch. ii.*, § 1, canon 1) that, when of two words or phrases one is susceptible of two significations and the other of only one, the latter, for the sake of avoiding obscurity, should be preferred; by this rule we should say an *oral* message, *oral* tradition, a *literal* translation. *Verbal* nicety or criticism is nicety or criticism about words.

verbalization (vĕr-bal-i-zā'shon), *n.* [*F. verbalize* + *-ation*.] The act of verbalizing, or the state of being verbalized. Also spelled *verbalisation*.

The *verbalization*, if I may so express it, of a noun is now a difficult matter, and we shrink from the employment even of well-authorized old nominal verbs.

Verbasceæ (vēr-bas'ē-ē), *n. pl.* [*NL.* (G. Don, 1835), < *Verbascum* + *-ææ*.] A tribe of gamopetalous plants, of the order *Scrophularineæ* and series *Pseudosolanææ*. It is characterized by flowers in terminal spikes or racemes, having a wheel-shaped or rarely concave corolla with five broad lobes, of which the two upper are exterior. It includes the 3 genera *Staurophragma*, *Celsia*, and *Verbascum*.

Verbascum (vēr-bas'kum), *n.* [*NL.* (Tournefort, 1700; earlier in Brunfels, 1530), < *L. verbasum*, mullen.] A genus of plants, type of the tribe *Verbasceæ* in the order *Scrophularineæ*. It is distinguished from the other genera of its tribe by its five perfect stamens. About 140 species have been described, many of them hybrids or varieties; only 100, or a few more, are now admitted. They are natives of Europe, North Africa, and western and central Asia. They are herbs, usually biennial, more or less clad in floccose wool, commonly tall and erect, rarely low and branching or spiny. The soft alternate leaves vary from entire to pinnatifid. The flowers are yellow, purplish, red, or rarely white, solitary or clustered in the axils of bracts, and disposed in terminal spikes or racemes, less often in panicles. The fruit is a two-valved capsule, globular, egg-shaped, or flattened. The stem-leaves are sessile and often decurrent; the radical leaves (frequently very large), coarse and conspicuous. The leaves of *V. Thapsus*, the common mullen, are mucilaginous and somewhat bitter, are used as emollient applications to tumors, and are the source of several popular remedies. (See *mullen*, with cut.) Four species are naturalized in the United States; 6 are natives of Great Britain, and about 50 others of continental Europe. *V. Lychnitis* and *V. puberulentum*, the white mullens of England and other parts of Europe, produce stiff branching panicles of yellow flowers with white-bearded filaments; they are covered with a white powdery down which readily rubs off. About a dozen yellow-flowered species are thought worthy of cultivation for ornament, among which *V. Chaizi* is remarkable for its tall stem, 10 feet high, with large green leaves, and enormous branching panicles of yellow flowers with purplish filaments. *V. phoeniceum*, from southern Europe, is peculiar in its large spike of showy violet flowers.

Verbena (vēr-bē'nā), *n.* [*NL.* (Tournefort, 1700; earlier in Brunfels, 1530), < *L. verbenā*, usu. in pl. *verbenæ*, foliage, leaves, branches used in sacred rites, also plants used as cooling remedies; see *vervain*.] **1.** A genus of plants, type of the order *Verbenaceæ* and tribe *Verbeneæ*. It is characterized by flowers sessile in an elongated or flattened spike, and by a dry fruit with four one-seeded nutlets or cells included within an unchanged tubular calyx. There are about 80 species, mostly American. One, *V. officinalis*, is widely dispersed over warm and temperate parts of the Old World; another, *V. Bonariensis*, is naturalized in Africa and Asia; one only, *V. supina*, is peculiar to the Old World, and occurs in the Mediterranean region from the Canary Islands to western Asia; another, *V. macrostachya*, is confined to Australia. They are diffuse decumbent or erect summer-flowering herbs (shrubby in a few South American species), commonly villous with unbranched hairs. Their leaves are usually opposite, and incised or dissected; their flowers are sessile, and solitary in the axils of the narrow bracts of a terminal spike. The spikes are compact and thick, or long

and slender, sometimes corymbed or panicle. About 14 species are natives of the United States, mostly weedy and small-flowered; 5 of these occur within the north-eastern States, of which the principal are *V. hastata*, the blue, and *V. urticifolia*, the white vervain, tall plants with long panicle or clustered spikes. For *V. officinalis*, the chief introduced species, see *vervain*, *herb of the cross* (under *herb*), *pigeon's-grass*, *simpler's-joy*, and *ent* under *laciniate*. Four southwestern species produce large showy pink or purplish flower-clusters, which elongate into spikes in fruit; among these *V. bipinnatifida* (*V. montana*) and *V. Aubletia* are sometimes cultivated. The latter is a creeping and spreading perennial with incised leaves, parent of many garden hybrids; it occurs in open places from Florida to Illinois, Arkansas, and Mexico, in nature with rose-colored, purple, or lilac flowers. The numerous cultivated *verbenæ*, very popular in the United States from their brilliant and continuous bloom and from their growth in masses, are largely derived from the South American species *V. chaco-drifolia*, *V. phlogifolia*, *V. tenuicoides*, and *V. erinoides*, in nature respectively scarlet, rose-colored, white, and lilac-purple. In cultivation they include all colors except yellow and pure blue; many are striped; and the best have a distinct eye, or bright central spot. Several species are also very fragrant, especially *V. tenuicoides*, *V. venosa* is more often cultivated in England. **2.** [*L. c.*] A plant of this genus.—**Lemon-scented verberna.** Same as *lemon-verberna*.

Verbenaceæ (vēr-bē'nā'sē-ē), *n. pl.* [*NL.* (Justicium, 1806), < *Verbenā* + *-æææ*.] An order of gamopetalous plants, of the series *Bicarpellatæ* and cohort *Lamiatæ*. It is characterized by an inferior radicle, usually opposite leaves, and irregular bisexual flowers, and is particularly distinguished from the nearly related order *Labiatæ* by an entire ovary and a fruit with either two or four nutlets. It includes about 740 species, belonging to 65 genera, classed in 8 tribes, of which the types are *Phryma*, *Stilbe*, *Cloanthus*, *Verbena*, *Vitex*, *Caryopteris*, *Symphoricarpos*, and *Avicennia*. They are either herbs, shrubs, or trees. Their leaves are usually opposite or whorled, entire, toothed, or incised, and without stipules. The inflorescence is a spike, raceme, panicle, or cyme, either simple or compound. The corolla is usually small, commonly with a distinct tube which is often incurved, five or frequently four imbricate flat-spreading lobes, and four didynamous stamens; some genera produce only two stamens or a two-lipped corolla with one or more lobes enlarged or erect. The ovary contains at first one, soon two, and at length commonly four cells, each cell usually with one ovule; in fruit it becomes more or less drupaceous, with a juicy, fleshy, or dry exocarp, and an indurated endocarp, which is indehiscent, or breaks into two or four nutlets, or rarely more. They are rare in the north temperate zone, common in the tropics and in temperate parts of South America. They are herbaceous in colder regions, becoming shrubby in the tropics, or even very large trees, as the teak. The fruit is sometimes edible, as in species of *Lantana* and *Premna*, but is more often acid. Their properties are sometimes aromatic. Many are of medicinal repute, as species of *Callicarpa*, *Conoclea*, and *Clerodendron*. (Compare *Stachytarpheta* and *Vitex*.) Many genera are cultivated for ornament, as *Verbena*, *Lantana*, and *Clerodendron*, or for the colored fruit, as *Callicarpa*. Only 4 genera are native within the United States—*Lippia*, *Callicarpa*, *Phryma*, and *Verbena*.

Verbesina (vēr-bē-sī'nā), *n.* [*NL.* (Linnaeus, 1737), altered from *Verbena* on account of a resemblance in the leaves of the original species.] A genus of composite plants, of the tribe *Helianthoidææ*, type of the subtribe *Verbesineææ*. It is characterized by small or middle-sized corymbose flower-heads (sometimes large, solitary, and long-peduncled) with the rays fertile or rarely lacking, and by achenes laterally compressed, distinctly two-winged, sometimes ciliate, and usually awned by a pappus of two rigid or slender bristles. There are about 55 species, natives of warm parts of America, occurring from the Argentine Republic to Mexico, and with 9 species in the southern United States, one yellow-flowered species, *V. occidentalis*, and perhaps also the white-flowered *V. virginica*, extending north into Pennsylvania. A few species are naturalized in the Old World. They are herbs or sometimes shrubby, a few becoming small trees of about 20 feet in height, and are known as *crown-beard*. Their leaves are usually toothed and opposite, and the petioles decurrent. The flower-heads are usually yellow; after blossoming, they are apt to become ovoid or globose by the elevation of a conical receptacle. *V. encelioides* of Texas, Arizona, and Mexico, now widely dispersed through warm regions, is cultivated for its yellow flowers, sometimes under the name of *Ximenesia*.

verd-antique (vêrd-an-têk'), *n.* [*< OF. verd antique*, F. *vert antique*, 'ancient green,' = It. *verde antico*: see *vert* and *antique*.] An ornamental stone which has long been used and highly prized, having been well known to the ancient Romans. It consists of serpentine, forming a kind of breccia, mingled or interveioed with a much lighter material, usually calcite, but sometimes magnesite or ateatite, and sometimes a lighter-colored serpentine, the whole forming, when polished, an extremely beautiful material for constructive purposes or for interior decoration. Serpentine of various kinds and of different shades of color were obtained from Italian quarries, and also from those of Greece and Egypt, and were called by various names, according to the region from which they came: thus, *verde di Prato*, *verde di Genova*, *verde di Pegli*, etc. The *verde di Prato*, quarried near Florence, has been extensively used in various important buildings in that city, as in the cathedral and the campanile of Giotto, as well as in the church of Sta. Maria Novella. Serpentine of the verd-antique type has also been quarried and used in various other regions, as in Cornwall; in the counties of Galway, Donegal, and Sligo in Ireland; in Banffshire, Scotland; and in Vermont and Connecticut in the United States. The objections to its use in outdoor construction are that, as a general rule, it does not stand the weather well, and that it is not easily obtained in large blocks sufficiently free from flaws to justify their use. Also called *ophicalcite*.

The hills of Antioch are part of them of a crumbling stone, like *verd antique*.

In law, the answer of a jury given to the court concerning any matter of fact in any cause, civil or criminal, committed to their trial and examination. In criminal causes the usual verdict is "guilty" or "not guilty"; in Scotland it may be "not proven." In civil causes it is a verdict for the plaintiff or for the defendant, according to the fact. These are called *general verdicts*. In some civil causes, when there is a doubt as to how the law ought to be applied to the facts, a *special verdict* is given finding and stating specific facts, and leaving the court to draw the proper conclusion. See *jury*.

— **Sealed verdict**, a verdict reduced to writing and sealed up for delivery to the court: a method sometimes allowed, to avoid detaining the jury, after they have reached an agreement, until the next session of the court. — **Special verdict**, a verdict in which the jury find the facts and state them as proved, but leave the conclusion to be drawn from the facts to be determined by the court according as the law applicable thereto may require. =Syn. 1. *Decree*, *Judgment*, etc. See *decision*.

'green of copper' (*æris*, gen. of *æs*, copper or bronze). Cf. OF. *verdet*, *verdigris*, dim. of *verd*, green.] A substance obtained by exposing plates of copper to the air in contact with acetic acid, and much used as a pigment, as a mordant in dyeing wool black, in calico-printing, and in gilding, in several processes in the chemical arts, and in medicine. Verdigris, like all the compounds into which copper enters, is poisonous; and it is very apt to form on the surface of copper utensils, owing to the action of vegetable juices. It is, chemically, a crystalline salt known as the basic acetate of copper. It ranges in hue from green to greenish-blue, according to the proportions of acetic acid and copper contained. As a pigment it is fairly permanent, but has little body, and is generally used only as a glazing color.

Vermes (vēr'mēz), *n. pl.* [**NL.**, pl. of **L.** *vermis*, a worm, = **E.** *worm*.] 1. Worms: formerly including animals resembling the common earthworm, but having no exact classificatory sense, and hence no standing in zoölogy.—2†. The sixth and last division of animals in the Linnean "Systema Naturæ" (1766), defined as consisting of those animals which have tentacles, cold white blood, and an inauriculate unilocular heart, and comprising all animals which Linnaeus did not dispose under the five other classes *Mammalia*, *Aves*, *Amphibia*, *Pisces*, and *Insecta* (or vertebrates and insects). This class *Vermes* was divided into five orders, *Intestina*, *Mollusca*, *Testacea*, *Lithophyta*, and *Zoöphyta*, comprising all invertebrates except insects, and was thus the waste-basket of Linnaeus (as *Radiata* was of Cuvier).

3. One of the eight primary divisions of the animal kingdom; a subkingdom or phylum, one of the leading types of animal life, comprising all those animals which have a body-eavity (*Metazoa*), no backbone (*Invertebrata*), normally an intestinal canal (which *Caentera* have not), not a radiate structure (which *Echinodermata* have), legs if any not jointed (they are always jointed in *Arthropoda*), and body vermiform if there are no legs. In this acceptation *Vermes* form a most comprehensive group, of great diversity of form, but agreeing in certain fundamental structural characters, being generally soft vermiform animals, oftenest segmented and bilaterally symmetrical, without limbs or with unjointed limbs. *Vermes* thus defined are approximately equivalent—(a) in Lamarck's system (1801-1812), to a class of animals divided into the four orders *Molles*, *Rigiduli*, *Hispiduli*, and *Epizoorie* (the last including lernæan crustaceans); (b) in the Cuvierian classification (1817), to the whole of Cuvier's first class of *Articulata* (the annelids of Lamarck, or red-blooded worms with unjointed legs) plus his second and third classes of *Radiata* (*Apoda* and *Entozoa*), plus some of his fourth class of *Radiata* (some *Polyzoa*), plus his first order (*Rotifera*) of his fifth class of *Radiata*; (c) in Huxley's classification (1869), to the classes *Polyzoa*, *Scoticeida*, *Annelida*, *Charognatha*, and therefore to his two subkingdoms, *Annuloida* and *Annulosa*, without the *Echinodermata* of the former, and without the *Crustacea*, *Arachnida*, *Myriapoda*, and *Insecta* of the latter: or, in other terms, to his *Annuloida* minus *Echinodermata* and plus the whole of the anarthropodous *Annulosa*. *Vermes* as here defined have been divided into seven classes: (1) *Platyelmintha*, with three orders, respectively the turbellarian, trematoid, and cestoid worms; (2) *Nematemintha*, with two orders, the nematoid and acanthocephalous worms—most of these two classes, excepting the *Turbellaria*, being entozoic or ectozoic parasites, as tapeworms, threadworms, etc.; (3) *Chaetognatha*, based on the single exceptional form *Sagitta*; (4) *Gephyrea* (being Cuvier's second order of *Echinodermata*); (5) *Annelida*, or ordinary segmented worms, with four orders—*Hirudinea* (leeches), *Oligochaeta* (earthworms, etc.), *Polychaeta* (lobworms, sea-worms, etc.), and *Cephalobranchia* (tubicolous worms, etc.); (6) *Rotifera*, the wheel-animalcules; (7) *Polyzoa* (by most naturalists now dissociated from *Vermes*). The tendency at present is to break up the unmanageable group and discard the name.

The total abandoning of the indefinite and indefensible group of *Vermes*.
Encyc. Brit., XXIV. 812.

The animal has a reduced foot, a single elongated gill, short tentacles, and the eyes at the external sides of the tentacles. The operculum is corneous and circular. The young shells are regularly conic and spiral, like those of *Furritella*; but as they grow the whorls separate, and often become crooked or contorted.

The kermes- or cochineal-insect; also, the product of cochineal; worm-dye.—2. The red sulphid of mercury, or the mineral cinnabar, occurring in nature of a red-brown to a carmine-red color; also, a pigment formerly made by grinding selected pieces of native cinnabar, but now made artificially. The pigment is produced in two ways. (a) In the wet way mercury, sulphur, potash, and water are mixed together in proper proportions, put into horizontal iron cylinders containing agitators, and stirred constantly for about an hour. The mass first turns black, then brick-red, and finally acquires the desired vermilion-red color. The potash is simply a carrier, and does not enter into the composition of the finished product. (b) In the dry way mercury and sulphur are mixed and heated in a kind of retort, the vermilion red subliming over. By slight variations in the process the color may be made pale or deep in shade, and may even be made at will to incline toward scarlet, crimson, or orange. As a pigment it is permanent, becoming dark rather than light on exposure. It possesses great body, and is a very brilliant and vivid red, toning toward orange. It is used extensively in painting and decorating, for making red seal-

wax, and for other purposes. The name *artificial vermilion* is also applied to a vermilion red made by precipitating the coal-tar color eosin on orange mineral. It is quite equal in color, brilliancy, and body to that made from quicksilver; but it is not very permanent under the direct action of the sun, unless protected by a coat of varnish.

vernier (vēr'ni-ēr), *n.* [*F. vernier*, named after Pierre Vernier (1580–1637), who invented the instrument in 1631.] A small movable scale, running parallel with the fixed scale of a sextant, theodolite, barometer, or other graduated instrument, and used for measuring a fractional part of one of the equal divisions on the graduated fixed scale or arc. It consists, in its simplest form, of a small sliding scale, the divisions of which differ from those of the primary scale. A space is taken equal to an exact number of parts of the primary scale, and is divided into a number of equal parts either greater by 1 or less by 1 than the number that it covers on the primary scale. Fig. 1 represents the vernier of the common barometer for measuring to the hundredth of an inch.

The scale is divided into inches and tenths of inches; the small movable scale is the vernier, which consists of a length of eleven parts of the main scale divided into ten equal parts—each part being therefore equal to eleven tenths of a division on the main scale, and the difference between a scale-division and a vernier-division being one hundredth of an inch. To use the vernier, the zero or top line of it is set to coincide with the top of the barometric column, which in the figure stands between 30.1 and 30.2 inches. If the zero of the vernier were set to coincide with 30.1 inches on the scale, the first division would be one hundredth of an inch below 30 on the scale, division 2 two hundredths below 30, and so on, division 10 coinciding with 29 inches. Hence, as the vernier is raised its divisions coincide successively with scale-divisions, and the numbers on the vernier correspond to the hundredths it has been raised. In the figure the coincidence is at the seventh vernier-division—that is, the vernier stands seven hundredths of an inch above 30.1, and the height of the mercury is therefore 30.17 inches. Fig. 2 represents part of the limb of a sextant with a vernier. Also called *vernier*. See also *cut* under *caliper*, *square*, and *transit*.—**Vernier-scale sight.** See *sight*¹.

Vernonia (vēr-nō'ni-ā), *n.* [*NL.* (Schreber, 1791), named after William Vernon, an English botanist, who collected plants in Maryland near the end of the 17th century.] A genus of composite plants, type of the tribe *Vernoniaceæ* and subtribe *Euvernoniæ*. It is characterized by a polymorphous inflorescence, usually with a naked receptacle, ten-ribbed achenes, and a pappus of two or three series, the inner slender, copious, and elongated, the outer much shorter, often more chaffy, sometimes absent. There are about 500 species. They are chiefly tropical, abundant in America, numerous in Africa, and frequent in Asia. A few occur beyond the tropics, in North and South America and South Africa. One Asiatic species, *V. cinerea*, is very common also in Australia, and is naturalized in the West Indies. None occurs in Europe. They are shrubs or herbs, usually with straight, crisped, woolly or tangled hairs, rarely stellate or scurfy. The leaves are alternate, entire or toothed, feather-veined, petioled or sessile, but not decurrent; in *V. oppositifolia* and *V. eupatoriifolia* of Brazil they are opposite. The fruit consists of smooth or hirsute achenes, commonly glandular between the ribs. The flowers are purple, red, bluish, or rarely white; they form terminal flower-heads, which are usually cymose and panicled, or corymbose, sometimes solitary or glomerate. The large section *Lepidoploa* includes over 200 American species, chiefly with many-flowered subspherical corymbed heads; to this belong the 10 or more species of the United States, which are known as *ironweed*, perhaps from the hardness of their stems, and are peculiar in their usually crimson flowers, brown or rusty-colored pappus, and resinous-dotted achenes. They are polymorphous, and disposed to hybridize. *V. noveboracensis*, also known as *flattop*, extends north to New England; *V. altissima*, to Pennsylvania; and *V. fasciculata*, to Ohio and the Dakotas; the others are chiefly southwestern. *V. arborescens* is the fleabane of Jamaica. A decoction of *V. cinerea* is used in India as a febrifuge. The small black seeds of *V. anthelmintica*, a common annual of India, yield by pressure a solid green oil known as *khatzum*- or *kinka-oil*, esteemed of value in the arts.

Vernoniaceæ (vēr-nō-ni-ā'sē-ō), *n. pl.* [*NL.* (C. H. F. Lessing, 1829), < *Vernonia* + *-acæ*.] A tribe of composite plants, characterized by flower-heads with all the flowers similar and tubular, and usually by setose or chaffy pappus and alternate leaves. From the *Eupatoriaceæ*, the other similar tribe of uniformly tubular-flowered *Compositæ*, it is further distinguished by its sagittate anthers and its subulate style-branches, which are usually much elongated, stigmatose along the inner side, and minutely hispid externally. It includes 41 genera, classed in 5 groups or series—one of these series, the subtribe *Lych-nophoræ*, peculiar in its densely glomerate small flower-heads, the others composing the subtribe *Euvernoniæ*, with the flower-heads separate, and usually panicled or solitary. They are herbs or shrubs, rarely trees. Their leaves are alternate (except in 3 species), not opposite, as commonly in the *Eupatoriaceæ*, and are entire or toothed, not dissected, as often in other composite tribes. Their flowers are purple, violet, or white, never yellow, frequent as that color is in the order. One genus, *Stokesia*, is blue-flowered. Two genera, *Elephantopus* and *Vernonia* (the type), extend into the middle United States. The tribe abounds in monotypic genera, chiefly Brazilian, with two confined to the West Indies, one to Australia, and three or four to tropical Africa.

It. veronica*; < *ML. veronica*, a napkin supposed to be impressed with the face of Christ (popularly connected with *L. vera*, true, + *L. Gr. εἰκών*, image; see *very*, *icon*), < *Veronica*, the traditional name of the woman who wiped the Saviour's face, ult. identical with *Berenice*, *Bernice*, the traditional name of the woman cured of the issue of blood, *L. Berenice*, also *Beronice*, and contr. *Bernice*, < *Gr. Βερενίκη*, the name of the daughter of King Agrippa and of other women, Macedonian form of *Gr. φερηνίκη*, lit. 'bearer of victory,' < *φέρειν*, = *E. bear*¹, + *νίκη*, victory (see *Nike*). Hence ult. *vernicle*.]

1. A napkin or piece of cloth impressed with the face of Christ: from the legend that a woman named Veronica wiped the face of Christ with her handkerchief when he was on his way

to Calvary, and that the likeness of the face was miraculously impressed upon the cloth. Also *vernicle*.—2. [*cap.*] [*NL.* (Rivinus, 1690); earlier, about 1534, by Mattioli.] A genus of gamopetalous plants, of the order *Scrophularinæ* and tribe *Digitaliæ*, type of the subtribe *Veroniceæ*. It is characterized by opposite lower leaves, a wheel-shaped corolla with a very short tube and spreading lobes, and by two stamens with their anther-cells confluent at the apex. About 220 species have been described, perhaps to be reduced to 150. They are widely scattered through temperate and cold regions, and are usually low herbs, their stem-leaves almost always plainly opposite, but the floral leaves always alternate, and commonly diminished into bracts. *V. Virginia* is exceptional in its whorled leaves. The flowers are blue, often penciled with violet, and varying to purple, pink, or white, but never yellow; they form terminal or axillary racemes, or are solitary and sessile in the axils. The fruit is a loculicidal or four-valved capsule, often obtuse or notched, rarely acute. The species are known as *speedwell*, especially *V. Chamædris*, also called *forget-me-not* (see *speedwell*). A few are of medicinal repute, especially *V. Virginia*, known as *black-root*

and *Culver's-root* or *Culver's-physic*, a tall perennial with wand-like stem from 2 to 6 feet high, and a white spike from 6 to 10 inches long, occurring in Canada, the eastern and central United States, Japan, and Siberia. The leaves of *V. officinalis* have been used as a medicinal tea; the so-called Mont Cenis tea is from *V. Albionii*. Twelve species are natives of England, 60 of Europe, 6 of Alaska, and 11 of the United States proper, only two of which are confined to North America: *V. cusickii*, a large-flowered alpine plant of Oregon and California, and *V. americana*, known as *brooklime*, a petioled aquatic with purple-striped pale-blue flowers, distributed from Virginia and New Mexico to Alaska. The similar *V. beccabunga* of the Old World is the original brooklime. Five other species are now naturalized in the United States; of these, *V. peregrina* and *V. serpyllifolia* are almost cosmopolitan. (See *neckweed*, and *Paul's betony* under *betony*.) For *V. hederifolia*, see *henbit*; and for *V. officinalis*, see *speedwell* (with cut) and *stuelen*. Many foreign species (at least fifty) are valued for cultivation in gardens, as *V. longifolia*, or for rockeries, as *V. repens*, a creeper forming a mat of pale-blue flowers. Many are of variegated colors, as *V. saxatilis*, an alpine plant with blue violet-striped flowers, narrowly ringed with crimson around the white center. Numerous species occur in high southern latitudes, 14 in Australia, and 24 in New Zealand, one of which, *V. elliptica*, extends to Cape Horn, and sometimes becomes a small tree 20 feet high. The genus reaches its greatest development in New Zealand, where it is present in remarkable beauty and abundance. Nearly all the species are shrubby, usually from 2 to 6 feet high, and are cultivated under glass, especially *V. salicifolia* and *V. speciosa*, with wine-colored flowers, the largest-leaved species, as also *V. formosa* of Tasmania. *V. buxifolia*, with purple-veined white flowers, is sometimes known as *New Zealand box*; and *V. perfoliata*, of southern Australia, as *digger's-speedwell*. *V. tetragona* of New Zealand, from its hard imbricated decussate connate leaves, has been mistaken for a conifer.

It occurs in numerous localities both north and south of the Alps, and in northern Italy, sometimes in masses of great thickness, which often take on a gneissoid or schistose structure. In certain localities the verrucano overlies a slaty rock which contains plants of Carboniferous age: hence some geologists have considered it as belonging to that formation, while others have regarded it as the equivalent of the Rothliegende, the lower division of the Permian.

2. (a) A succession of words written in one line; hence, a sentence, or part of a sentence, written, or fitted to be written, as one line; a stich or stichos. It was a custom in ancient times to write prosaic as well as metrical books in lines of average length: (See *colometry*, *stichometry*.) This custom was continued especially in writing the poetical books of the Bible, which, though not metrical in form, are composed in balanced clauses, and in liturgical forms taken from or similar to these. Hence — (b) In *liturgics*, a sentence, or part of a sentence, usually from the Scriptures, especially from the Book of Psalms, said alternately by an officiant or leader and the choir or people: specifically, the sentence, clause, or phrase said by the officiant or leader, as distinguished from the response of the choir or congregation; a versicle. In the hour-offices a verse is especially a sentence following the responsory after a lesson. In the gradual the second sentence is called a *verse*, and also that following the alleluia. Also *versus*. (c) In *church music*, a passage or movement for a single voice or for soloists, as contrasted with *chorus*; also, a soloist who sings such a passage. (d) A short division of a chapter in any book of Scripture, usually forming one sentence, or part of a long sentence or period. The present division of verses in the Old Testament is inherited, with modifications, from the masoretic division of verses (*pesuqim*), and has been used in Latin and other versions since 1528. The present division of verses in the New Testament was made by Robert Stephens, on a horseback journey from Paris to Lyons, in an edition published in 1551. In English versions the verses were first marked in the Geneva Bible of 1560. (e) A similar division in any book. — **Adonic**, **Alcaic**, **Alcmanian verse**. See the adjectives. — **Blank verse**, unrimed verse; particularly, that form of unrimed heroic verse which is commonly employed in English dramatic and epic poetry. It was introduced by

the Earl of Surrey (d. 1547), in his translation of the second and fourth books of the *Æneid*. It was first employed in the drama in Sackville and Norton's tragedy of "Ferrex and Porrex," which was printed in 1565; but it was not till Marlowe adopted it in his play of "Tamburlaine the Great" that it became the form regularly employed in the metrical drama, which it has since with only occasional intervals remained. After Milton's use of it in "Paradise Lost" it was widely extended to many other classes of composition.—**Elegiac verse.** See *elegiac*, 1.—**Fescennine verses.** See *Fescennine*.—**Heroic, Hipponocætean, long, Saturnian, serpentine, society, etc., verse.** See the qualifying words.—**To cap verses.** See *capl.*—**Verse Lyon.** See the quotation.

Another of their pretie inventions was to make a verse of such wordes as by their nature and manner of construction and situation might be turned backward word by word, and make another perfit verse, but of quite contrary sense, as the gibing monks that wrote of Pope Alexander these two verses.

Lans tua non tua fraus, virtus non copia rerum,
Scandere te faciunt hoc deus eximium.
Which if ye will turne backward they make two other good verses, but of contrary sense; thus,
Eximium deus hoc faciunt te scandere, rerum
Copia, non virtus, fraus tua non tua laus.
And they called it *Verse Lyon*.

vertebra (vēr'tē-brā), *n.*; pl. *vertebræ* (-brē). [Formerly in *E.* form *vertebre*, *q. v.*; = *F.* *vertebre* = *Sp.* *vertebra* = *Pg.* *It.* *vertebra*, **<** *L.* *vertebra*, a joint, a bone of the spine, **<** *vertere*, turn, turn about: see *verse*.] 1. In *Vertebrata*, any bone of the spine; any segment of the backbone. See *backbone* and *spine*. Specifically—(a) Broadly, any axial metamere of a vertebrate, whether osseous, cartilaginous, or merely fibrous, including the segments of the skull as well as those of the trunk. (b) Narrowly, one of the usually separate and distinct bones or cartilages of which the spinal column consists, in most cases composed of a centrum or body, with or without ankylosed ribs, and with a neural arch and various other processes. The centrum is the most solid and the axial part of the bone, with which a pair of neurapophyses are sutured (see cuts under *cervical* and *neurocentral*), these apophyses forming the pedicles and laminae of human anatomy, united in a neural spine or spinous process. Each neurapophysis bears a diapophysis, the transverse process of human anatomy, and a prezygapophysis and a postzygapophysis, called in man the *superior* and *inferior oblique* or *articular processes*, by means of which the successive arches are jointed; together with, in many cases, additional processes connected with these (the anapophyses, metapophyses, and parapophyses), the trace of one of which in the lumbar vertebrae of man is known as the *mammillary tubercle*. (See cuts under *atlas*, *endoskeleton, dorsal, hypapophysis*, and *lumbar*.) Certain other formations on the neurapophyses provide in some cases for the additional interlocking of these arches. (See *zygosphene*, *zygantrum*.) The above-named processes are either autogenous or endogenous, or else exogenous, in different cases and in different animals; they are all that ordinary vertebrae present; and all of them may abort, especially in the caudal region, or be disguised, as by ankylosis, in the sacral region. (See cuts under *epileura*, *sacrum*, and *sacrum*.) The centrum of certain vertebrae of some animals bears a single median inferior process. (See *hypapophysis*.) Vertebral centra do not always correspond exactly to neural arches, owing to intercalation of additional bodies (perhaps corresponding to ordinary intervertebral disks), so that a given arch, like most ribs, may articulate with two centra. (See *intercentrum*, *embolomerous*, *rachitomous*.) Bodies of free vertebrae articulate with one another by their faces, usually with the intervention of a pulpy fibrocartilage. According to the shapes of these faces, they are described as *amphicoelium*, *procoelium*, *opisthocelium* (see these words), and *heterocoelium*, and also called *biconcave*, *convexo-convex*, *convexo-concave*, and *saddle-shaped*. Arches of vertebrae are often connected, as in many fishes, with dermal bones. (See *interhemal*, *interneural*.) Ordinary vertebrae are conveniently grouped, according to the region they occupy, as *cervical*, *dorsal* or *thoracic*, *lumbar*, *sacral*, and *caudal* or *coccygeal*, respectively indicated in vertebral formulae by the letters C, D, L, S, Cd. In man and most mammals this grouping is well marked by the developed or undeveloped condition of the ribs in the three former regions, and by extensive ankyloses in the two latter, as well as by the size, shape, and other characters of the individual bones; but such distinctions fail of application to some vertebrates. Cetaceans and sirenians have no sacrum to separate lumbar from caudal vertebrae; some cetaceans have consolidated cervicals (see cut under *ankylosis*); birds have extensively ankylosed dorsals and a remarkably complex sacrum (see cuts under *sacrum* and *sacrum*); snakes have vertebrae gently graded in character from head to tail; in fishes the vertebrae are ordinarily grouped as *abdominal*, which extend from the head as far as the cavity of the belly extends, and *caudal*, all the rest of the bones, including some special elements (see *heterocercal*, *homocercal*, *epural*, *hypural*). Such regional variations in the characters of vertebrae also give rise to the terms *cervicodorsal*, *dorsolumbar*, *lumbosacral*, *urosacral*, etc. Certain vertebrae have individual names, as *atlas*, *axis*, *odontoid*; see also phrases given below. The number of vertebrae varies widely; it is greatest in some reptiles (over 200). Seven cervicals is the rule in mammals, with rare exceptions (see *skull*); but there is no constancy, as regards number, in any of the other regions of the spinal column. See *skeleton* and the cuts there cited, also cuts under *atlas*, *axis*, *chevron-bone*, and *zenarthal*.

2. In *echinoderms*, any one of the numerous axial ossicles of the arms of starfishes. See *vertebral*, *ar.* 5.—**Cranial vertebra**, any one of the segments of the skull which has been theoretically assumed to be homologous with a vertebra proper, as by Goethe, Carus, Oken, Owen, and others. Three or four such vertebrae have been recognized in the composition of the skull, named as follows, from behind forward: (1) the *occipital* or *epineurial*, nearly or quite coincident with the compound occipital bone, of which the basoccipital

is the centrum, the exoccipitals are the neurapophyses, and the supra-occipital is the neural spine (see cuts under *Cyclobolus*, *Esos*, and *skull*); (2) the *parietal*, *mesencephalic*, or *otic*, represented mainly by the basiophenoid as centrum, the alisphenoids as neurapophyses, and the parietals as a pair of expansive neural spines, but also including parts of the skull of the ear (see cuts under *Baleenidæ*, *parietal*, *sphenoid*, and *tymppanic*); (3) the *frontal*, *prosencephalic*, or *ophthalmic*, represented mainly by the presphenoid as centrum, the orbitosphenoids as neurapophyses, and the frontal or frontals as a single or bifid neural spine (see cuts under *craniofacial*, *Gallina*, and *sphenoid*); (4) the *nasal*, *rhinencephalic*, or *olfactory*, based mainly upon the vomer, ethmoid, and nasal bones. Hemal arches of each of these theoretical vertebrae are sought in the facial, hyoidean, and branchial arches. Three of these supposed vertebrae are distinctly recognizable in most skulls as cranial segments; but these segments are exclusive of the capsules of the special senses, and are not regarded as vertebral, since their cartilaginous basis is not metamericly segmented. vertebral (vēr'tē-bral), *a. n.* [= *F.* *vertebralis* = *Sp.* *vertebralis* = *It.* *vertebrale*, **<** *NL.* *vertebralis*, **<** *L.* *vertebra*, a joint, vertebra: see *vertebra*.] I, *a. 1.* Of the nature of a vertebra; characteristic of or peculiar to vertebrae: as, *vertebral* elements or processes; *vertebral* segmentation.—2. Pertaining or relating to a vertebra or to vertebrae; spinal: as, *vertebral* arteries, nerves, muscles; a *vertebral* theory or formula.—3. Composed of vertebrae; axial, as the backbone of any vertebrate; spinal; rachidian: as, the *vertebral* column.—4. Having vertebrae; backboneed; vertebrate: as, a *vertebral* animal. [Rare.]—5. In *Echinodermata*, axial: noting the median ossicles of the ray of any starfish, a series of which forms a solid internal axis of any ray or arm, each ossicle consisting of two lateral halves united by a longitudinal suture, and articulated by tenon-and-mortise joints upon their terminal surfaces. See *Ophiuridæ*, and cuts under *Asteriidæ* and *Astrophyton*.

Each of these ossicles (which are sometimes termed *vertebral*) is surrounded by four plates—one median and antambulacral, two lateral, and one median and superambulacral. *Huxley*, Anat. Invert., p. 482.

6. In *entom.*, situated on or noting the median line of the upper surface.—**Anterior vertebral vein**. See *vein*.—**Vertebral aponeurosis**, a fascia separating the muscles belonging to the shoulder and arm from those which support the head and spine, stretched from the spinous processes of the vertebrae to the angles of the ribs, beneath the serratus posticus superior, and continuous with the fascia nucha. Also called *vertebral fascia*.—**Vertebral artery**, a branch of the subclavian which passes through the vertebral canal to enter the foramen magnum and form with its fellow the basilar artery. It gives off in man posterior meningeal, anterior and posterior spinal, and inferior cerebellar arteries.—**Vertebral arthropathy**, a form of spinal or tabetic arthropathy accompanied by changes in shape of the vertebrae.—**Vertebral border of the scapula**, in *human anat.*, that border of the scapula which lies nearest the spinal column. See *foramen* and *vertebrartrial*.—**Vertebral formula**, the abbreviated expression of the number of vertebrae in each of the recognized regions of the spinal column. The formula normal to man is C, 7, D, 12, L, 5, S, 5, Cd, 4 = 33.—**Vertebral muscles**, axial (cervical, paraxial, or hypaxial) muscles which lie along the trunk in relation with vertebrae or vertebral segments. In the lower vertebrates, whose axial musculature is segmented into numerous myocommata (the flakes of the flesh of fish, for example), such muscles are coincident, to some extent, with vertebrae. In the higher, most of the vertebral muscles extend undivided along several vertebrae, though their segmentation may be traced in their deeper layers or fascicles, as in the so-called fourth and fifth layers of the muscles of the back of man. Those hypaxial muscles which lie under (in man, in front of) the vertebrae are grouped as *prevertebral*, as the scaleni of the neck and psoas of the loins.—**Vertebral ossicle**. Same as *ambulacral ossicle* (which see, under *ambulacral*). See also *vertebra*, 2, and *vertebra*, *a.* 5.—**Vertebral plexus**. See *plexus*.—**Vertebral ribs**, in man, the two lowest ribs on each side, connected with the vertebrae only; the floating ribs; distinguished from *vertebrochondral* and from *vertebrosternal ribs*.—**Vertebral vein**. See *vein*.

vertebrarterial (vēr-tē-brār-tē'ri-āl), *a.* Pertaining to a vertebra and an artery: specifically noting a foramen in the side of a cervical vertebra transmitting the vertebral artery. A vertebrarterial foramen is formed by the partial confluence of a rudimentary cervical rib, or pleurapophysis, with the transverse process proper, or diapophysis, of a cervical vertebra; the series of such foramina constitutes the vertebrarterial canal. This structure is one of the distinguishing characters of a cervical vertebra in man and many other animals. Also *vertebro-arterial*. See cut under *cervical*.

Vertebrata (vēr-tē-brā'tā), *n. pl.* [NL., neut. pl. of L. *vertebratus*, jointed, articulated: see *vertebrate*.] A phylum or prime division of the animal kingdom, containing all those animals which have a backbone or its equivalent; the vertebrates, formerly contrasted with all other animals (*Invertebrata*), now ranked as one of seven or eight phyla which are severally contrasted with one another. This division was formally recognized in 1788 by Batsch, who united the four Linnean classes then current (*Mammalia*, *Aves*, *Amphibia*, and *Pisces*) under the German name *Knochenthiere*; and next in 1797 by Lamarck, who called the same group in French *animaux à vertèbres*, and contrasted it with his *animaux sans vertèbres*, whence the New Latin terms *Vertebrata* and *Invertebrata*. But this identical classification, with Greek names, is actually as old as Aristotle, whose Ένακτα (*Enakta*) or 'blooded' animals, were the vertebrates, divided, moreover, into four classes exactly corresponding to the modern mammals, birds, reptiles with amphibians, and fishes, and contrasted with his Άνακτα (*Anakta*) or 'bloodless' animals, these being all invertebrates. Vertebrates are the most highly organized metazoans, with permanent distinction of sex, and consequent gametic reproduction without exception. Their essential structural character is the presence of an axon from head to tail, dividing the trunk into an upper neural canal or tube containing the main nervous cord, and an under hemal cavity or cavities containing the principal viscera of digestion, respiration, circulation, and reproduction, together with a sympathetic nervous system. Except in the lowest class of vertebrates (*Acrania*), the head has a skull and brain (*Cranata*). The alimentary canal is completely shut off from the body-cavity, and open to the exterior at both ends. Special organs of respiration are confined to this canal, and form in the higher vertebrates lungs and in the lower gills, the latter structures being developed in connection with certain visceral clefts (see *slit*), 5) and arches which are present in embryos of all vertebrates, but which for the most part disappear in those above amphibians. Organs of circulation are present in two main systems—the blood-vascular, consisting of a heart or its equivalent, arteries, veins, and capillaries, and the lymph-vascular, consisting of lymphatic bodies and vessels. These two systems communicate with each other, and the lymphatic with both the mucons and the serous cavities of the body; the blood-vascular system is otherwise closed. The main nervous system is primitively tubular; except in *Acrania*, it becomes differentiated into a brain and spinal cord, from both of which pairs of nerves ramify in nearly all parts of the body, and effect intricate anastomoses with the sympathetic system. Organs of the special senses are present, with sporadic exceptions, especially of the eye. The organs of reproduction in both sexes are connected with the alimentary canal, except in a few fishes and in all mammals above marsupials. Ova are matured either within or without the body of the female. The embryo or fetus develops from a four-layered germ, whose epiblast is the origin of the cuticle and main nervous axis, whose hypoblast lines the alimentary canal, and whose mesoblast, splitting into somatopleural and splanchnopleural layers, forms a body-cavity and most of the substance of the body. All vertebrates have an endoskeleton and an exoskeleton, the former constituting the main framework of the body, and the latter inclosing it in space. The *Vertebrata* have been variously classified: (a) Upon physiological considerations, into (1) oviparous, ovoviviparous, and viviparous; (2) cold-blooded and warm-blooded, or *Hæmatocerya* and *Hæmatothermia*; (3) those with nucleated and those with non-nucleated blood-cells, or *Pyrenemata* and *Apirenemata*. (b) Upon mixed physiological and anatomical grounds, into (1) those with gills and those without them, or *Branchiata* and *Abranchiata*; (2) those without amnion and allantois in the embryo, and those with these embryonic organs, respectively the *Anamnionata* or *Anallantoidea*, and the *Amnionata* or *Allantoidea*. (c) Upon the most general considerations, mainly structural, the *Vertebrata* have been determined to fall most naturally into three subphyla or superclasses, defined alike by various authors under different names. These are (1) fishes and amphibians together; (2) reptiles proper and birds together; (3) mammals alone. These three brigades have become best known under Huxley's names—(1) *Ichthyopsida*, (2) *Sauropsida*, (3) *Mammalia*. They are also called (1) *Lurifera*, (2) *Quadrifera*, (3) *Malleifera*. The classes into which vertebrates were long directly divided without brigading were originally four: *Pisces*, fishes; *Amphibia*, amphibians and reptiles; *Aves*, birds; *Mammalia*, beasta. Next there were five, by separation of the second of these divisions into the classes *Amphibia* and *Reptilia* proper. Finally, the origi-

nal class *Pisces* was dismembered into four classes: *Lepidocardia* or *Pharyngobranchii* or *Cirrostromi*, the lancelets or acranial vertebrates alone; *Marsipobranchii* or *Cyclostomi*, the monorhine vertebrates, or lampreys and hags; *Selachii* or *Elastobranchii*, the sharks and rays; and *Pisces* proper, or ordinary fishes. (See *fish*.) None of the divisions of *Amphibia*, *Reptilia*, or *Mammalia* are usually accorded the rank of classes; so that the phylum *Vertebrata* is now usually taken to consist of the eight classes above noted. After the discovery by Kowalevsky, in 1866, of the possession of a notochord by the embryos of ascidians and by some adults of that group (see *urochord*, and cut under *Appendicularia*), the *Tunicata*, under the name of *Urochorda*, were added to the *Vertebrata*, and the larger group thus composed was called *Chordata* by Huxford. Later the worm-like organisms of the genus *Balanoglossus* were admitted to the same association, and it has been supposed that some others (as *Cephalodiscus* and *Rhabdopleura*) may require to be considered in the same connection. With such extension of the scope of *Vertebrata*, or rather the merging of that group to a higher one comprising all the chordate animals which agree in possessing a (temporary or permanent) notochord, a dorsal neural axis, and pharyngeal slits, the arrangement of *Chordata* becomes (1) *Hemichorda*, the acorn-worms; (2) *Urochorda*, the tunicates; (3) *Cephalochorda*, the lancelets or acranial vertebrates; and (4) *Vertebrata* proper, or ordinary skulled vertebrates.

They are herbs with entire sinuate or pinnatifid leaves, hoary with short forked or branching hairs. The flowers are large and golden-yellow in the American species; the others differ in habit, in their larger broadly winged seeds, and in their yellowish flowers, which become commonly whitish or purplish in fading. They are known as *bladder-pods*, especially *V. These vesicles appear (unlettered) in the cut under *embryo*. The three commonly become five by subdivision of two of them, corresponding to the five main encephalic segments which are recognized in most vertebrates, and may be specified by the name of the segment to which they respectively give rise, as the *prosencephalic*, etc., *vesicle* (see cut under *viscerat*). Certain other vesicular protrusions of the embryonic encephalon provide for the formation of so much of the organs of the special senses of smell and sight as is derived from the brain, one being the *rhinencephalic vesicle*, the other the *ocular, ophthalmic, or optic vesicle*; both of these are paired. See cuts under *ammon* and *cerebral* (cut 4).

Its hollow is primitively continuous with that of a lateral cerebral ventricle, and may persist as a rhinocoele, but it is usually obliterated.—**Seminal vesicles**, two membranous receptacles for the semen, situated one on each side of the base of the bladder, between it and the rectum. In man each consists of a tube of about the size of a quill, of from 4 to 6 inches in length when unrolled, somewhat coiled, and repeatedly doubled upon itself, ending opposite the base of the prostate by uniting with a vas deferens to form an ejaculatory duct. Seminal vesicles exist in the males of many animals, being in general hollow offsets from or diverticula of the deferent duct of the testis or its equivalent, but also existing under many different modifications, especially in invertebrates. The more comprehensive name of such formations is *spermatocyst*. The corresponding structure in the female of some invertebrates, for the reception and detention of the male semen, is a *spermatheca*. They are short-bodied wasps with folded wings, and are commonly known in the United States as *yellow-jackets* or *hornets*. Their nests consist of a series of combs arranged one below another, and enveloped in a papery covering. In tropical regions these nests reach an immense size, those of a Ceylonese species often measuring 6 feet in length. Twenty species occur in the United States and 14 in Europe. *V. maculata* of North America is the so-called *white-faced hornet*, and is isotypical with the European *V. crabro*. The observance of this hour is mentioned in the third century by St. Cyprian. The chief features of the Western *vespers*, besides the psalms and varying hymn, are the Magnificat and the collect for the day. The chief features of the Greek *vespers* (ἑσπερινός) are the psalms, the ancient hymn "Joyful Light," the prokeimenon, and the Nunc Dimittis. The old English name for *vespers* is *even-song*. The Anglican public evening prayer, also called *even-song*, is mainly a combination and condensation of the Sarum *vespers* and complin, the part of the office from the first Lord's Prayer to the Magnificat inclusive representing *vespers*. Most of the longer-known bats have been placed in *Vespertilio*. By successive eliminations, the genus has been restricted to about 40 small species, of both hemispheres, as the pipistrelle of Europe, *V. pipistrellus*, and the little brown bat of the United States, *V. subulatus*, and is regarded as the type of a family *Vespertilionidae*. The genus now includes only the smallest and most delicately formed bats, like those just named, having ample wings, the tail inclosed in the interfemoral membrane, no leafy appendage to the nose, no special development of the ears, six grinding teeth in each half of each jaw, and four upper and six lower incisors. It is distinguished, like other *Gymnorhina*, from the *Histiophora*, or leaf-nosed section, by the absence of any nasal appendage, and from the true blood-sucking bats by the character of the dentition and digestive organs, and from other *Gymnorhina* by having the tail inclosed in an ample interfemoral membrane, and special characters of the teeth and skull. The nearest relationships are with the molossid bats (*Molossidae* and *Noctilionidae*). The family contains numerous genera, as *Vespertilio*, *Synotis*, *Plecotus*, *Atalapha*, *Antrozous*, *Myotis*, *Lasiurus*, etc., and about 150 species (or more than one third of the whole order *Chiroptera*) of small bats of most parts of the world. Some of these are also very rich in individuals, and among the best-known representatives of the whole order. The family is primarily divided into two subfamilies, *Vespertilioninae* and *Myotisinae*. See cut under *Synotis*.

They are characterized by their two-spurred middle tibiae and simple tarsal claws. Every species exists in the three forms of male, female or queen, and worker. The males and workers die in the fall, and the impregnated queen alone hibernates. She forms a new colony in the spring, giving birth at first only to workers, and later to males and females. The nests are made of paper, and the young are fed by the workers with nectar and animal and vegetable juices. The principal genera besides *Vespa* are *Polistes* and *Polybia*. Over the vest of this form a coat is generally worn.

5. An undergarment knitted or woven on the stocking-loom. *Vest* and *undervest* are more common in England; *undershirt* in the United States.

Vesta (ves'tā), *n.* [*L., = Gr. Ἑστία, the goddess of the hearth, √ vas, Skt. √ ush, burn:*

see *astion, Aurora, Easter.*] 1. One of the chief divinities of the ancient Romans, equivalent to the Greek Hestia,

one of the twelve great Olympians, the virgin goddess of the hearth, presiding over both the private family altar and the central altar of the city, the tribe, or the race. She was worshiped along with the Penates at every meal, when the family assembled round the altar or hearth, which was in the center of the house. Aeneas was said to have carried the sacred fire (which was her symbol) from Troy, and brought it to Italy, and it was preserved at Rome by the state in the sanctuary of the goddess, which stood in the Forum. To guard this fire from becoming extinguished, it was watched and tended by six stainless virgins, called *vestals*. The Roman temples of Vesta were circular, preserving the form of the primitive huts of the Latin race, because it was in such a hut that the sacred fire was first tended by the young girls while their parents and brothers were absent in the chase or pasture-ground. See also cuts under *hut-urn* and *monopteron*.

The Giustiniani Statue of Vesta (Hestia).—Torlonia Museum, Rome.

2. The fourth planetoid, discovered by Olbers, at Bremen, in 1807.—3. [*l. c.*] A wax match which may be ignited by friction.

The door of a small closet here attracted the young man's attention; and, striking a *vesta*, he opened it and entered.

R. L. Stevenson, *The Dynamiter*, p. 178.

vestal (ves'tal), *a. and n.* [= *F. vestale, n.*, = *Sp. Pg. vestal* = *It. vestale*, < *L. Festalis*, of Vesta, as a noun (*sc. virgo*) a vestal virgin, < *Festa*, Vesta: see *Vesta*.] I. *a.* 1. Of or pertaining to Vesta, the classical goddess of the sacred fire and of the household and the state.

When thou shouldst come,

Then my cot with light should shine

Purer than the vestal fire.

Drayton, *Shepherd's Sirena*.

2. Pertaining to or characteristic of a vestal virgin or a nun.

Vestal modesty.

Shak., *R. and J.*, iii. 3. 38.

My vestal habit me contenting more

Than all the robes adorning me before.

Drayton, *Matilda to King John*.

II. *n.* 1. Among the ancient Romans, a virgin consecrated to Vesta and to the service of watching the sacred fire, which was kept perpetually burning upon her altar. The vestals were at first four in number, afterward six. They entered the service of the goddess at from six to ten years of age, their term of service lasting thirty years. They were then permitted to retire and to marry, but few did so, for, as vestals, they were treated with great honor, and had important public privileges. Their persons were inviolable, any offense against them being punished with death, and they were treated in all their relations with the highest distinction and reverence. A vestal who broke her vow of chastity was immured alive in an underground vault amid public mourning. There were very few such instances; in one of them, under Domitian, the chief of the vestals was put to death under a false charge trumped up by the emperor.

Hence—2. A virgin; a woman of spotless chastity; sometimes, a virgin who devotes her life entirely to the service of religion; a nun; a religieuse.

Shall 's go hear the vestals sing?

Shak., *Pericles*, iv. 5. 7.

She would a dedicated vestal prove,

And give her virgin vows to heaven and love.

Crabbe, *Works*, VII. 94.

vested (ves'ted), *p. a.* 1. Clothed; especially, wearing, or having assumed, state robes or some ceremonial costume: as, a vested choir.

A troop of yellow-vested white-haired Jews,
Bound for their own land, where redemption dawns.

Browning, *Paracelsus*, iv.

2. In *her.*, clothed; draped: used especially when the clothing is of a different tincture from the rest of the bearing. This blazon is more

usual when only a part of the body is represented. Also *clothed*.—3. Not in a state of contingency or suspension; fixed. In law: (a) Already acquired; existing in contemplation of law, in a certain person as owner; as, a law is not to be construed so as to impair vested rights without compensation. See *right*. (b) Noting the quality of a present absolute right or interest, as distinguished from that which is defeasible. Thus, a legacy is said to be vested when given in such terms that the legatee has a present right to its future payment which is not defeasible, and he can therefore extinguish it by release. (c) Noting the quality of a present estate even though defeasible, as distinguished from that the very existence of which is contingent. Thus, a devise of land is said to be vested when the circumstances are such that the legatee is existing and known, and would be immediately entitled to possession were the precedent estate to terminate, although the time may not have come when he is entitled to receive it, and although it is possible that before that time comes another person may come into being who will take in preference to him. Meanwhile it is said to be vested in interest, but not vested in possession.—**Vested remainder**. See *remainder*, 3.

vestor (ves'tēr), *n.* One who invests money or other property; an investor. [Rare.]

Conv.*, *Dlogenes* and *Plato*.

3. A vestibule; a place of entrance; a court. Thel wenten . . . in the hows of a manner man in Bahurym, that had a pit in his *vestiary*. *Wyclif*, 2 Ki. [Sam.] xvii. 18.

2. In *anat.*: (a) A part of the labyrinth of the ear, the common or central cavity, between the semicircular canals and the cochlea, communicating permanently with the former, and temporarily or permanently with the latter, from the proper membranous cavity of which it is generally shut off subsequently, opening into the tympanum or middle ear by the fenestra ovalis, which, however, is closed in life by a membrane. 2. In *biol.*, any vestigial organ or tissue, having little or no utility, but corresponding to a useful part existing in some lower animal. See *vestigial* and *rudiment*, 3.—**Syn.** See *trace*¹.

vestigia, *n.* Plural of *vestigium*.

vestigial (ves-tij'i-āl), *a.* [*< L. vestigium*, footprint (see *vestige*), + *-al*.] Of, pertaining to, or of the nature of a vestige; like a mere trace of what has been; also, rudimentary. In biology *vestigial* has a specific application to those organs or structures which are commonly called *rudimentary*, and are rudimentary in fact, but which are properly regarded, not as beginnings or incipient states, but as remains of parts or structures which have been better developed in an earlier stage of existence of the same organism, or in lower preceding organisms, and have aborted or strophied, or become otherwise reduced or rudimental in the evolution of the individual or of the species. Thus, the parovaria, the canals of Gartner, the male womb, the thalamus, and the round ligament of the liver are vestigial structures with reference to the Wolfian bodies and allantois of the fetus; the thymus of the adult is vestigial with reference to that structure in the infant; the vermiform appendix of the colon is vestigial with reference to the very large caecum of a ruminant; the stunted coracoid process of the scapula of a mammal is a vestigial structure with reference to the large articulated coracoid bone of a bird. Vestigial structures of any kind, or the remains of what has been, are to be carefully distinguished from rudimentary structures, or the beginning of what is to be (as fully explained under *rudimentary*). They are very significant biological facts, of which much use has been made by Darwin and other modern evolutionists in tracing lines of descent with modification and determining probable ancestry.—**Vestigial fold**, a projection of the pericardium over the root of the left lung, caused by a cord which is the remains of the nearly obliterated ductus (Cuvieri), or sinus of Cuvier, of the fetus.—**Vestigial**

muscle, a muscle, like those of the external ear, which is of use in the lower animals, but poorly developed and scarcely functional in man.—**Syn.** *Abortive*, etc. See *rudimentary*.

vestigiary (ves-tij'i-ā-ri), *a.* [*< L. vestigium*, footprint, + *-ary*.] Vestigial.

vestigium (ves-tij'i-um), *n.*; pl. *vestigia* (-i). [*L.*; see *vestige*.] In *anat.*, a vestige; a vestigial structure of any kind; a trace, as the pit which marks the closed foramen ovale between the right and left auricles of the heart.—**Vestigium foraminis ovalis**, the fovea or fossa ovalis.—**Vestigia rerum**, traces of things. See the quotation.

It is not to be doubted that those motions which give rise to sensation leave in the brain changes of its substance which answer to what Haller called "*vestigia rerum*," and to what that great thinker, David Hartley, termed "Vibratinnules."

Huxley, Address before the British Association at Belfast, 1874.

vestment, *n.* An obsolete variant of *vestment*. **vesting** (ves'ting), *n.* [*< vest + -ing*.] Cloth especially made for men's waistcoats: most commonly in the plural.

vestlet (ves'tlet), *n.* [*< vest + -let*.] A tubiculous sea-anemone of the genus *Cerianthus*, as *C. borealis*. It is not fixed to any support, and remarkably resembles a cephalobranchiate worm, having a long, smooth, slender body or stalk tapering to a free base, and surmounted by a large double wreath of tentacles. The stem is a tube secreted by the polyp and investing it (whence the name). It is 6 or 8 inches long, and the wreath expands an inch or more. See *Cerianthus*, and compare cut under *Edwardsia*.

Vestlet (*Cerianthus borealis*), one third natural size.

vestment (vest'-ment), *n.* [Formerly also *vestment*, *vestment*; < *ME. vestement*, < *OF. vestement*, *F. vêtement* = *Sp. vestimento*, *m.*, *vestimenta*, *f.*, = *Pg. vestimenta* = *It. vestimento*, *m.*, *vestimenta*, *f.*, < *L. vestimentum*, clothing, covering, < *vestire*, clothe; see *vest*, *v.*] 1. A covering or garment; some part of clothing or dress; an article of clothing; especially, some part of outer clothing; specifically, a ceremonial or official robe or garment.

Chaucer, *Knight's Tale*, l. 2090.

The judges in their *vestments* of state attended to give advice on points of law. *Macaulay*, *Warren Hastings*.

2. *Eccles.* (a) One of the garments worn, in addition to the cassock and ordinary dress, by the clergy and their assistants, choristers, etc., during divine service and the administration of the sacraments; especially, one of the garments so worn by the celebrant, deacon, and subdeacon during the celebration of the eucharist; specifically, the chasuble, or the chasuble with the other eucharistic garments and ornaments, especially the amice, stole, and manipule. From monumental and other evidence it appears that the type of the principal ecclesiastical vestments has always been nearly the same; that this agreed on the whole with the general style of dress among Greeks, Romans, and Orientals; and that in certain respects it agreed with official rather than common civil dress and with Syrian rather than Greek or Roman costume. (b) One of the cloths or coverings of the altar.

vestral (ves'trāl), *a.* [*< vestry + -al*.] Of or pertaining to a vestry.

vestrify (ves'tri-fi), *v. l.*; pret. and pp. *vestrified*, ppr. *vestrifying*. [*< vestry + -fy*.] To make a vestry of, or make like a vestry; turn into a vestry. [Rare.]

vestry (ves'tri), *n.*; pl. *vestries* (-triz). [*< ME. vestrye*, < *OF. vestiaire* (?), *vestiaire*, *F. vestiaire*, < *L. vestiarius*, a wardrobe; see *vestiary*. For the terminal form, cf. *sectry*.] 1. A room, or sometimes a separate building, attached to a church, where the vestments of the clergy,

and sometimes the sacred vessels and other treasures of the church, are kept. Such an apartment is also called *sacristy* or *vestry-room*. It is now, in Anglican churches, generally under the same roof with the church, and is usually placed at one side of the chancel.

(b) A meeting or a board consisting of representatives of the ratepayers at large, all of whom are entitled to vote in their election. It is not essential to the validity of the meeting that it be held in the vestry, or even in connection with the church-building. The general charge of the church property is intrusted to the vestry, together with certain administrative duties respecting the parish, such as the care of the poor, and sometimes the paving and lighting of the streets, etc.

The farmers whom he met at *vestry*.

T. Hughes, *Tom Brown at Rugby*, 1. 3.

4. In the *Prot. Epis. Ch.* in the United States of America, a committee (chosen annually by the members of the congregation) who, in conjunction with the churchwardens, manage its temporal affairs. The time and manner of electing the vestrymen, and their rights and duties, are different in different dioceses, being determined by diocesan regulations. The vestry has a general charge of the temporalities of the church, and, in the case of a vacancy in the pastorate, is the official representative of the parish; but it exercises no ecclesiastical control over the rector, either in his administration of the spiritual affairs of the church or in the conduct of its services. It nominates the rector of the parish, subject to the approval of the bishop.—**Common vestry**, an assembly of the ratepayers at large.—**Select vestry**, a board consisting of representatives of the ratepayers; sometimes called *select vestry* only when renewed by filling its own vacancies, and *general vestry* when filled by election by the ratepayers at large.

veto (vê'tô), *n.* [= F. *veto*, < L. *veto*, I forbid (see def.), 1st pers. pres. ind. act. of *vetare*, forbid, prohibit, oppose, hinder.] 1. In a constitutional government, the right vested in one branch of it to negative the determinations of another branch; specifically, the right, under constitutional restrictions, of the executive, as a king, a president, or a governor, to reject a bill passed by the legislature; also, the act of exercising this right. This power is often traced to the privilege enjoyed by the Roman tribunes of annulling or suspending any measures of the senate, decree of a magistrate, etc., the word *veto* (I forbid) having been at least occasionally used by the tribune in such a case. This power of the tribunes was properly called *intercessio*. The attempt on the part of Louis XVI. of France to exercise the veto assured to him by the Constitution of 1791 was one of the causes of the revolutionary movements of 1792, which at once dethroned the king and overturned the Constitution. In Great Britain the power of the crown is confined to a veto, a right of rejecting and not resolving, and even this right has become practically obsolete, the last occasion of its exercise being in the reign of William III. The Constitution of the United States provides that "every Bill which shall have passed the House of Representatives and the Senate, shall, before it become a Law, be presented to the President of the United States. If he approve, he shall sign it; but if not, he shall return it with his Objections to that House in which it shall have originated, who shall enter the Objections at large on their Journal, and proceed to reconsider it. If after such Reconsideration two-thirds of that House shall agree to pass the Bill, it shall be sent, together with the Objections, to the other House, by which it shall likewise be reconsidered, and if approved by two-thirds of that House, it shall become a Law. . . . If any Bill shall not be returned by the President within ten Days (Sundays excepted) after it shall have been presented to him, the Same shall be a Law, in like Manner as if he had signed it, unless the Congress by their Adjournment prevent its Return, in which Case it shall not be a Law." (Article I. Sec. 7.) Most of the State Constitutions have a similar provision.

A man who might be afraid to defeat a law by his single veto might not scruple to return it for re-consideration.

A. Hamilton, Federalist, No. 73.

Afterwards the *veto* message of President Jackson put an end to legislation upon local routes.

T. H. Benton, Thirty Years, I. 26.

Veto. By this expression (Lat. *veto*, 'I forbid') is understood in public law the constitutional right of the competent authority, or in republics of the whole people in their primary assembly, to protest against a legislative or administrative act, and to prevent wholly, or for the time being, the validation or execution of the same.

Encyc. Brit., XXIV. 206.

The Court of Session, and subsequently the House of Lords (in 1839), declared this act of the assembly to be illegal; and the dissensions that consequently arose within the church culminated in the disruption of 1843.

2. In *physics*, an oscillating, reciprocating, or any kind of stationary motion made by a body, as a pendulum, musical cord, elastic plate, or mass of air, when forced from the position, figure, or volume of equilibrium, under the influence of forces of restitution. When the reciprocating movement is comparatively slow, as that of a pendulum, which is produced by the action of gravity on the whole mass of the body, the term *vibration* is commonly used, while the term *oscillation* is generally confined to a motion with rapid reciprocations or revolutions, as that of a sonorous body, which proceeds from the attractions (with perhaps some repulsions) of the molecules of the body on each other when a disturbance takes place in their state of equilibrium. In the case of a vibrating string or rod, the vibrations are distinguished as *transverse* or *longitudinal*, according to the direction of the oscillating movement relatively to the length of the sonorous body. The term *vibration* is also applied to the motion (generally an elliptical revolution) which is produced among the particles of a fluid or ethereal medium when their equilibrium is disturbed by any impulse, by which means waves or undulations are caused. In all cases one complete vibration means the double movement of the particle or vibrating body to and fro about the position of equilibrium, while the movement forward and backward on one side only is a half-vibration. The laws of vibratory motion form the foundation of the theories devised by modern science to account for the phenomena of acoustics and optics. See *sound*⁵, and *vandulatory theory of light* (under *light*), 1, also cuts under *nodal* and *sonometer*.

The phenomena of polarization demonstrated . . . that the vibrations of light take place at right angles to the direction of the rays.
Lommel, Light (trans.), p. 351.

3. In *med.*, same as *fremitus*.—4. In *nat. hist.*, movement to and fro, especially when quick,

continuous, regular, and of little amplitude; a quivering or shivering motion; tremulousness; tremor: as, the vibration of aspen-leaves on their compressed petioles in the breeze; the vibration of the ear-drum under sound-waves; the vibration of a fly's wings in flight. The word is also somewhat specifically applied to ciliary action, or the motion of microscopic bodies, as cilia, flagella, vibracula, vibríos, spermatic filaments, and the like, vibration being the most obvious activity of such objects, and a usual means of locomotion, of ingestion of food, etc.—**Amplitude of a simple vibration**. See *amplitude*.—**Amplitude of vibration**, the maximum excursion or displacement of a vibrating body or particle from a position of rest.—**Free vibration**, a vibration whose period depends only upon the nature and form of the vibrating body: used in contradistinction to *forced vibration*, when the period is more or less modified by some outside influence, as the vibrations of a neighboring body of slightly different pitch.—**Funipendulous vibration**. See *funipendulous*.—**Harmonic vibration**. Same as *simple harmonic motion* (which see, under *harmonic*).—**Lateral vibration**. See *lateral*.—**Period of vibration**, the shortest time between instants at which the displacement and velocity of the vibrating body are the same both in amount and in direction.—**Phase of vibrations**, the time elapsed at an assumed zero of time since the passage of the vibrating body through equilibrium divided by the complete period of vibration, this quotient being multiplied by 360°.

vibratiuncle (vi-brä'ti-ung-kul), *n.* [*< NL. *vibratiuncula*, dim. of *L. vibratio(n)-*, vibration: see *vibration*.] A small vibration. Also *vibratiuncle*. See the quotation under *vestigium*.

The brain, not the spinal marrow or nerves, is the seat of the soul, as far as it presides over the voluntary motions. For the efficacy of the motory vibratiuncles depends chiefly on that part of them which is excited within the brain.
Hartley, Theory of the Human Mind, i, § 3.

Hartley supposes that the vibrations excited by a sensory or other impression do not die away, but are represented by smaller vibrations, or vibratiuncles, the permanency and intensity of which are in relation with the frequency of repetition of the primary vibrations.

Huxley, Animal Automatism.

In *elect.* or *teleg.*, a reed the vibrations of which are made to open and close the electric circuit and hence transmit pulsatory currents; also, a reed acted on by pulsatory currents by means of an electromagnet, and hence made to respond to the vibrations of a corresponding reed sending these currents from a distance. See *harmonic telegraph*, under *telegraph*.—2. In the reed-organ, one of the reeds by which the tone is produced.—3. In *printing*, an inking-roller that has a vibrating as well as a rotary movement, which aids the distribution of ink on the inking-table of a cylinder-press.

W. K. Clifford, Lectures, I, 246.

2. Causing vibration.

The smoothness of the oil, and the vibratory power of the salt, cause the sense we call sweetness.
Burke, Sublime and Beautiful.

Vibrio (vib'ri-ŏ), *n.* [NL. (Cohn), *< L. vibrare*, vibrate: see *vibrate*.] 1. A genus or form-genus of *Schizomyces* or bacteria, by some authorities regarded as the same as *Spirillum*. They have cylindrical, curved, or spirally wound rigid cells, provided at each end with a cilium. They occur in infusions, in sea-water, etc. (See *Spirillum*, *Schizomyces*.) The genus is a very old one, having been characterized by O. F. Müller in 1786 as "elongate infusorians without external organs," and has included at times various minute animals which have nothing to do with it. See def. 3.

2. [*l. c.*; pl. *vibrios* or *vibriones* (vib'ri-ŏz, vib'ri-ŏ-nĕz).] A member of this genus; a vibriion; a motile bacterium.—3†. [*l. c.*] An animalcule like or mistaken for a bacterium, and misplaced in the genus *Vibrio*: an old name of some minute nematoids, as those species of *Tylenchus* which infest wheat and cause ear-cockles.

vibriion (vib'ri-on), *n.*; pl. *vibriones* (vib'ri-ŏ-nĕz). [*< F. vibriion*, *< NL. vibrio(n)-*: see *Vibrio*.] One of the microscopic motile filaments which may be developed in organic infusions; a vibriio; a motile bacterium. See *Vibrio*, 1.

See *Vibrio*, 3. Also called *Vibronia* and *Vibronina*, and referred to the *Infusoria*, as by Ehrenberg and by Dujardin.

vibronine (vib'ri-ŏ-nin), *a.* [*< vibriion* + *-ine*.] Pertaining to or resembling vibrios.

vibrissa (vi-bris'sä), *n.*; pl. *vibrissæ* (-ĕ). [NL., *< L. vibrissa*, usually in pl. *vibrissæ*, the hairs in the nostrils.] 1. In *mammal.*, one of the long, stiff bristles which grow upon the upper lip and elsewhere upon the head of most mammals; a whisker, as of a cat. They are tactile organs, or feelers, and are sometimes called *tactile hairs* (*pili tactiles*). There is a popular notion that the whiskers reach out just far enough on each side to enable the animal to judge whether a hole or other close passage is large enough for it to pass through, and very probably this is true in many cases. See cuts under *mouse*, *ocelot*, *panther*, *serval*, *tiger*, and *tiger-cat*.

2. In *ornith.*, a rictal bristle; one of the special set of long, slender, bristle-like or bristly feathers, devoid of vexilla proper, which grow in a series along each side of the rictus or gape of the mouth of many birds, as flycatchers, goatsuckers, and others. When very long, as in the goatsucker, they are sometimes called *vibrissæ pectinate*, and may have lateral filaments, as in the chuck-will-a-widow. The use of the vibrissæ is supposed to be to entangle the legs and wings of insects, and thus diminish or prevent their struggling when caught, as the bristles are observed to be specially well developed in insectivorous birds which take their prey on the wing. See cuts under *Platyrhynchus*, *flycatcher*, *goatsucker*, and *whippoorwill*.

3. In *human anat.*, one of the hairs which grow in the nostrils.—4. In *entom.*, one of the projecting lateral bristles on the upper border of the peristomium or mouth-cavity of certain *Diptera*.

Viburnum (vi-bĕr'num), *n.* [NL. (Tournefort, 1700), *< L. viburnum*, the wayfaring-tree.] 1. A genus of gamopetalous plants, of the order *Caprifoliaceæ* and tribe *Sambuceæ*. It resembles

Flowering Branch of Arrow-wood (*Viburnum dentatum*). a, flowers; b, fruits.

the related genus *Sambucus*, the elder, in its corymbose or thyrsoid inflorescence, but is distinguished by the absence of any pinnately parted leaves. There are about 80 species, natives of the northern hemisphere and of the Andes, with a few species elsewhere in the southern hemisphere and in Madagascar. They are shrubs or small trees, usually with opposite branchlets and large naked buds. The leaves are petioled and opposite, or rarely whorled in threes; they are entire, serrate or dentate, rarely lobed. The white or pinkish corymba of flowers are somewhat umbelled or paniced, and are axillary or terminal; the flowers are usually wheel-shaped, with five equal lobes, and a one- to three-celled ovary becoming in fruit a dry or fleshy ovoid or globose drupe usually one-celled and containing a single compressed and deeply furrowed seed. The fruit is edible but insipid in *V. Lentago*, acid in *V. Opulus*, astringent in others, in which it is said, however, to be edible after fermentation, and to have been made into cakes by the North American Indians. In several species, forming the section *Opulus* (also peculiar in its acaly buds), the marginal flowers, of a broad flat inflorescence, are enlarged and sterile. (See cuts under *hobble-bush* and *neutral*, and compare *guelder rose* and *snowball*.) In the five other sections the flowers are all alike, and the winter buds, unlike most plants of temperate regions, are without scales. In a few Himalayan and Chinese species (the section *Solomoninus*) the flowers are tubular, elongated, and paniced, and in a few others funnelliform. Three species occur in Europe,

of which *V. Tinus* is the laurustinus, a winter-flowering shrub of southern Europe, in Corsica forming large forests, often cultivated for its ornamental evergreen leaves, white blossoms, and dark-blue berries. *V. Opulus*, the cranberry-tree or high cranberry, in England also known as *white dogwood*, *marsh- or water-elder*, and *gaiter-tree*, is widely diffused through the north of both continents; in Norway it is used for the manufacture of small wooden articles, of spirits, and of a yellow dye. For the other European species, *V. Lantana*, see *ray-faring-tree*. Fourteen species occur within the United States: 11 in the northeast; the others, *V. ellipticum* near the Pacific, *V. densiflorum* and *V. obtortum* near the South Atlantic coast; *V. acerifolium* extends north to Fort Yukon, *V. pauciflorum* to Sitka. Two American species, *V. Lentago* and *V. prunifolium*, become small trees. The bark of several species is used in the United States as a domestic remedy, and the inner bark of *V. Lantana* is esteemed a vesicant in England. A beverage known as Appalachian tea is sometimes made from the leaves of *V. cassinoides*, an early-flowering, thick-leaved species of American swamps. Several species are known as *arrow-wood*, chiefly *V. dentatum* in the north, *V. molle* in the south, *V. ellipticum* in California. The species are somewhat widely known by the generic name, especially *V. acerifolium*, the maple-leaved viburnum, or dock-mackie. The sweet viburnum is *V. Lentago* (for which see *sheepberry*). *V. nudum* is known as *with-the-rod*, *V. prunifolium* as *black haw* or *stag-bush*, and *V. lantanoides* as *hobble-bush* or *American wayfaring-tree*. The preceding are among the most ornamental of native American shrubs, admired for their white flowers, usually compact habit, and handsome foliage, also for their fruit, a bright blue-black in *V. prunifolium*, *V. pubescens*, and *V. acerifolium*, blue in *V. dentatum* and *V. molle*, and bright-red in *V. Opulus*; that of *V. Lantana* is an orange-red turning dull-black. Garden varieties produced by cultivation from *V. Opulus* are the snowball, or guelder-rose, and the rose-elder. *V. rugosum* of the Canaries, *V. tomentosum* (*V. plicatum*) of northern China, and *V. cotinifolium* of Nepal, are also esteemed ornamental shrubs.

2. [*l. e.*] A plant of this genus.
vicar (vik'är), *n.* [Early mod. E. also *vicker*; < ME. *vicar*, *viker*, *vicair*, *vicaire* (also *vicary*, *q. v.*), < OF. (and F.) *vicaire* = Sp. Pg. It. *vicario*, < L. *vicarius*, substituted, delegated, as a noun a substitute, a deputy, vicegerent, vicar, proxy, < **vic* (*vic-*), found only in oblique cases (gen. *vicis*, etc.) and pl. *vices*, change, interchange; see *vices*.] 1. A person deputed or authorized to perform the functions of another; a substitute in office: as, the Pope claims to be *vicar* of Jesus Christ on earth.

He hath thee [the Virgin] made *vicare* and maistresse
 Of all the world. *Chaucer*, A. B. C., l. 140.
 Consider also the presence of the king's majesty, God's high *vicar* in earth.
Lattimer, 6th Sermon bef. Edw. VI., 1549.
 Antichrist wee know is but the Devil's *Vicar*.
Milton, On Def. of Ilumb. Remonst.

2. In *Eng. eccles. law*, the priest of a parish the tithes of which belong to a chapter or religious house, or to a layman, and who receives only the smaller tithes or a salary. The title is also now given to incumbents who would formerly have been known as perpetual curates (see *curate*).
 Ye persons and *vickers* that have cure and charge,
 Take hede to the same, and roue not at large.
Babees Book (E. E. T. S.), p. 354.
 All Rectors and *Vickers* of the same deanery (Bristol).
English Guilds (E. E. T. S.), p. 257.
 The distinction therefore of a parson and vicar is this: the parson has for the most part the whole right to all the ecclesiastical dues in his parish; but a vicar has generally an appropriator over him, entitled to the best part of the profits, to whom he is in effect perpetual curate, with a standing salary.
Blackstone, Com., l. xi.

3. In the *Rom. Cath. Ch.*, an ecclesiastic assisting a bishop and exercising jurisdiction in his name. He cannot perform acts properly belonging to the episcopate nor collate to benefices without special authority.—**Cardinal vicar**, an ecclesiastical dignitary in Rome who, as delegate of the Pope, performs his functions as local bishop of the diocese of Rome.—**Lay vicar**, **clerk vicar**, **secular vicar**. See *lay*.—**Vicar apostolic**, in *Rom. Cath. usage*, formerly, a bishop, archbishop, or other ecclesiastic to whom the Roman pontiff delegated a portion of his jurisdiction; now, a missionary or titular bishop stationed either in a country where episcopal sees have not yet been established or in one where the succession of Roman Catholic bishops has been interrupted.—**Vicar choral**, in the *Ch. of Eng.*, an assistant of the canons or prebendaries in such parts of public worship as are performed in the chancel or choir, especially in connection with the music. They may be either clergymen or laymen.

In all cathedrals of the old foundation in England, in St. David's, and in twelve Irish cathedrals, the *Vicars Choral* form a distinct corporation, the members of which vary in number from twelve to three: these corporations are distinct from the chapter as regards property, but in subjection to it as to the performance of the services.

It is characterized by a stanen-tube oblique at the apex, an ovary with many (rarely with two) ovules, and a style which is mostly filiform and more or less beaked, usually with a terminal dorsal tuft. About 200 species have been described, of which probably not over 100 are well defined. They are widely distributed through north temperate regions and South America; one species, *V. sativa*, long cultivated, is now naturalized within the southern hemisphere in the Old World. They are chiefly tendrill-climbers, rarely spreading herbs, or somewhat erect. The flowers are usually blue, violet, or yellowish. The fruit is a compressed two-valved pod with globose seeds. The species are known in general as *vetch*. *V. sativa* is cultivated in the Old World as a fodder-crop, also under the names of *fitches*, *tares*, and *lints*; 16 or more other species are also useful for forage. (See *tare*.) Several species are valued for their seeds, especially *V. faba* (*Faba vulgaris*), the horse-bean of Old World cultivation (for which see *Faba*, *bean*), *Mazagan*, *V. gigantea* (*V. Stuehensis*), a tall, robust purple-flowered climber growing from San Francisco to Sitka, produces seeds which when young resemble green peas in size and taste. Victoria (vik-tō'ri-ā), *n.* [< L. *Victoria*: see *victory*.] 1. The twelfth planetoid, discovered by Hind in London in 1850.—2. [NL. (Lindley, 1838), named after Queen Victoria of England, to whom the first flower which blossomed in cultivation was presented in 1849.] A genus of water-lilies, belonging to the order *Nymphaeaceae* and tribe *Nymphaeae*. It is characterized by an inferior ovary, upon which all the parts of the flower are inserted, and by sterile inner stamens. The only species, *V. regia*, is known as the *Victoria* or *royal water-lily*, in

Victoria Water-lily (*Victoria regia*).

Guiana (from the leaves) as *irupe* or *water-platter*, and sometimes as *water-maze*, from the use of the roasted seeds. The plant is an inhabitant of still waters from Paraguay to Venezuela, growing chiefly in secondary tributaries of the Amazon system. It produces a thick rootstock from which radiate long-petioled circular leaves, each often 6 feet across (sometimes 12), with an upturned rim about 3 inches high. Each leaf resembles a shallow circular floating tray, and is conspicuously marked with a network of depressed veins, between which the surface is swollen into slight quadrangular elevations resembling alligator-skin, which gradually disappear with age. The leaves are deep-green above, the under surface pink, and are set with strong, sharp, conical spines, which also clothe the petioles, peduncles, and ovary. The leaves are very strong; a single one has borne the weight of two men. A plant may produce as many as twelve leaves at once, filling a tank 20 to 40 feet across. The solitary floating flower is from 12 to 14 inches in diameter (sometimes 24), expanding at night white and fragrant, closing by day, and expanding for the last time the second evening. In one variety it is rose-color at the second expansion, but with the odor unpleasant, and partially expands a third time, then still deeper red, afterward withdrawing beneath the surface; in a third variety there is a sharp and beautiful contrast between outer white and central deep rose-red petals. Some have considered these distinct species. The flower consists of four sepals, numerous petals in many rows, the outer larger than the sepals, the inner gradually passing into the numerous stamens which fol-

low in many circles, at first petaloid and broad with small anthers, the inner narrow with longer anthers, the innermost differently formed and sterile. The numerous carpels are sunk within a dilated torus, and produce albuminous edible seeds resembling peas. The plant was first discovered in Bolivia by Haenke, 1801; it first flowered in England in November, 1849, and in the United States in 1853. Compared with other water-lilies, the flowers most resemble those of *Castalia*, and the leaves those of *Euryale*.

C., attributed to the school of Scopas, found in the island of Samothrace, where it stood on a pedestal representing the prow of a trireme, and now one of the chief ornaments of the Louvre Museum. The type and only species is *V. regia*, of South Africa, through the Transvaal to the Zambesi, and in the west to Damaraland. This is the *veuve de la cote d'Afrique* and *veuve à quatre brins* of early French ornithologists, the *shaft-tailed bunting* of Latham (1783), the *Vidua regia* of most writers. The male is 12 inches long, of which length the middle tail-feathers form three fourths or more; the color is black, varied with white, gray, brown, and buff; the bill and feet are coral-red. Principal Whidah-bird (*Vidua principalis*), male.

Viduinæ; the veeves, widow-birds, or whidah-birds. No type having been originally indicated, the name is practically continuous with *Viduinæ* in a narrow sense, and has been variously restricted by different writers, notably to *V. principalis* and *V. (Videstrella) regia*. The former of these has in the male the four middle tail-feathers immensely lengthened and wide throughout their length (not wire-shafted). It was originally described (and figured) by Edwards in 1760 as the *long-tailed sparrow*, by Brisson in the same year as *la veuve d'Angola*, by Linnaeus in 1766 as *Emberiza vidua*, *E. principalis*, and *E. sereua*, by Latham in 1783 as the *long-tailed, variegated*, and *Dominican bunting*, and by Cuvier in 1817 as *Vidua principalis*. The male is 10 inches long, of which length the ample middle tail-feathers make two thirds or more, the rest of the tail being scarcely 2 inches, and the wing being only 3; the color is black and white, chiefly massed in large areas, and varied with some buff and gray. The female lacks the extraordinary development of the tail, being scarcely 5 inches long, and is also quite different in color from the male. This bird is widely distributed in Africa. A second species is *V. hypocherina* (or *splendens*) of the Zanzibar district. For *V. regia*, see *Videstrella*; and for other forms, see *Viduinæ*.

Viduinæ (vid'ū-ī'nē), *n. pl.* [NL., < *Vidua* + *-inæ*.] A subfamily of *Ploceidæ*, named from the genus *Vidua*; the whidahs and related forms; variously restricted. (a) In a broad sense, lately adopted by some monographers, one of two sub-

Paradise Whidah-bird (*Steganura paradisæ*), male.

families of *Ploceidæ*, containing all those with very short or spurious first primary of slender falcate form, of whatever other character: opposed to *Ploceinæ* alone. It thus covers a very large series of about 40 genera of not only African, but also Oriental, etc., birds, including those usually called *Sperminæ*, as wax-bills, amadavats, blood-finches, scengals, strawberry-finches, sociable weavers, etc. See *Philetarus*, *Pyrenestes*, *Quela*, *Sperminæ*, *Amadina*, *Taeniopygia*, *Estrella*, with various cuts. (b) In a narrow sense, confined to those African forms in the males of which

the tail is longer than the wings, sometimes extraordinarily lengthened into an arched train or of other special figure; the whidahs proper. Two of these remarkable birds are described under *Vidua* and *Videstrella* respectively. A third is the widow of paradise, *Vidua* (or *Steganura*) *paradisæ*. This was first described and figured by Edwards in 1747 as the *red-breasted long-tailed finch*; by the early French ornithologists as *grande veuve d'Angola* and *veuve à collier d'or*; and is the original whidah-bird of Latham, 1783. In the male the four middle tail-feathers are broad and fattened, and two of them taper to mere filaments; the length is 11 inches, of which the tail makes 8; the wing is 3 inches; the color is chiefly black, varied with white, brown, and buff, and especially marked with a collar of orange-rufous. The female is quite different in color, and 6 inches long, of which the tail is only 2½. This whidah is widely distributed in Africa, and is the one oftenest seen in cages. A fourth is *Vidua (Linnæus) fischeri*, of East Africa, 10 inches long, with all four of the middle tail-feathers wired throughout. The foregoing are all the species in which the four middle tail-feathers are peculiar and the rest plain. But in other whidahs all the rectrices share more or less elongation. Such belong to the three genera *Chera*, *Coliuspasser* (or *Penthetria*), and *Penthetropsis*. *Chera proene* of South Africa is the epaulet-whidah, of which the male is glossy-black above and below, with scarlet shoulders, and 19 inches long, with a tail of 15 inches. This is the only member of its genus. The species of *Coliuspasser* are several, of which the best-known is *C. ardens* (with nearly twenty other New Latin names). The male of this is black above and below with a scarlet collar across the fore neck; it inhabits South Africa. *C. laticaudus*, *C. hartlaubii*, *C. albonotata*, and *C. eques* are the other species of this genus. The three members of the genus *Penthetropsis* furnish the remaining type of whidahs, in which the males are black, varied with bright-yellow, as *P. macrura* of western and equatorial Africa, and *P. macrocera* of northeastern Africa.

Vienna basin. In *geol.*, the name given to an orographically not very well defined area, having Vienna near its southwestern extremity and extending to the Bohemian mountains on the northwest and the Carpathians on the northeast, and underlain by a series of Tertiary rocks remarkable for their extent, size, and complicated development. This Tertiary belongs chiefly to the Neogene of the Austrian geologists (see *Neogene*), and is divided into several subgroups, beginning with the Aquitanian, followed (in ascending order) by the Sarmatian and Mediterranean subdivisions—these all being of Miocene age—and then by the Congerian or Pliocene. The Vienna basin opened out to the east into a broad Miocene inland sea, slightly brackish, and is believed to have been connected, in former times, with the Arabo-Caspian basin, and perhaps even with the Arctic Ocean. It also communicated with the basin of the upper Danube, and with an area lying north of the Carpathians—in both cases, however, by narrow channels. Some writers limit the name *Vienna basin* to a smaller area lying pretty closely adjacent to the northern flanks of the eastern Alps, and partly included within their spurs.

Hallucell.—**Bird's-eye view.** See *bird's-eye*.—**Dissolving views**, a name given to pictures thrown on a screen by a lantern in such manner that they appear to dissolve every one into that following, without any interval of blank between them. To cause the pictures to "dissolve," two lanterns are required, each of which projects its picture upon the same field on the screen, both being in the same focus. One picture being projected, to cause it to disappear gradually and the next to take its place, a sliding cap or hood is mechanically withdrawn from the front of the second lantern and placed before the first lantern. Another method is to turn on the gas of one lantern while shutting off the gas of the other. The result is the same by either method, the first picture disappearing as the second appears, the two melting one into the other till one is lost and the other becomes clear. By a recent improved method only one lantern is used, and by appropriate mechanism a picture is substituted for that preceding it so quickly that there is no appreciation of any interval between them.—**Field of view.** See *field*.—**In view of**, in consideration of; having regard to.—**On view**, open or submitted to public inspection; exhibited to the public: as, pictures placed on *view*.—**Point of view.** See *point*.—**Side view.** See *side* and *side-view*.—**To the view**, so as to be seen by everybody; in public.

There are about 45 species, natives of warm regions of both hemispheres. ground, and resembling the peanut. *V. tuteola* is known as *seaside bean*, and *V. unguiculata* as *red bean*, in the West Indies. One species occurs in the United States, *V. glabra*, a yellow-flowered hirsute twiner of brackish marshes from South Carolina to Mississippi.

E. vilayn*, etc.; < ME. *vilain, vilein, vileyn*, also sometimes *vilains, vilans, vileyns*, < OF. *vilein, vilain, vilain, vilain*, nom. also *vilains, vilains*, F. *vilain*, a farm-servant, serf, peasant, clown, scoundrel, also adj. base, mean, wicked, = Pr. *vilan, vila* = Sp. *villano* = Pg. *villão* = It. *villano*, < ML. *villanus*, a farm-servant, serf, clown, < L. *villa*, a farm; see *vill*. The forms *villain, vilein*, etc., are historically one, and the attempt to differentiate them in meaning is idle.] **I. n. 1.** A member of the lowest class of unfree persons during the prevalence of the feudal system; a feudal serf. In respect to their lords or owners the villains had no rights, except that the lord might not kill or maim them, or ravish the females; they could acquire or hold no property against their lord's will; they were obliged to perform all the menial services he demanded; and the cottages and plots of land they occupied were held merely at his will. In respect, however, of other persons besides their lord they had the rights and privileges of freemen. Villains were either *regardant* (which see) or *in gross*. They were in view of the law annexed to the soil (*ascripti* or *adscripti glebae*), belonging to a manor as fixtures, passing with it when it was conveyed or inherited, and they could not be sold or transferred as persons separate from the land. The latter belonged personally to their lord, who could sell or transfer them at will.

Villain? by my blood,
I am as free-born as your Venice duke!
Middleton, Blurt, Master-Constable, ii. 1.

The *villains* owe to the lord all sorts of dues and services, personal labour, among others, on the lands which form his domain; they may not leave the Manor without his permission; no one of them can succeed to the land of another without his assent; and the legal theory even is that the movable property of the *villain* belongs to the lord. Yet it may confidently be laid down that, in the light of modern research, none of these disadvantages

prove an absolutely servile status, and that all may be explained without reference to it.

Maine, Early Law and Custom, p. 305.
The *villain* was not a slave, but a freeman minus the very important rights of his lord.

E. A. Freeman, Norman Conquest, V. 320.

villain, *n.* and *a.* See *villain*.

villainage, villenage (vil'en-äj), *n.* [Also *villanage*; *cl. OF. villenage, vilenage, vilonage* (= Sp. *villanaje, ML. villanagium*), servile tenure, *cl. vilain, vilain*, etc., a farm-servant, villain: see *villain*. *Cl. villainage*.] A tenure of lands and tenements by base—that is, menial—services. It was originally founded on the servile state of the occupiers of the soil, who were allowed to hold portions of land at the will of their lord, on condition of performing base or menial services. Where the service was base in its nature, and undefined as to time and amount, the tenant being bound to do whatever was commanded, the tenure received the name of *pure villenage*; but where the service, although of a base nature, was certain and defined, it was called *privileged villenage*, and sometimes *villain socage*. The tenants in villenage were divided into two distinct classes. First, there were the *villani proper*, whose holdings, the hides, half-hides, virgates, and bovates (see *hide*, *holding*), were correlative with the number of oxen allotted to them or contributed by them to the manorial plow-team of eight oxen. Below the *villani proper* were the numerous smaller tenants of what may be termed the *cottier class*, sometimes called in *Liber Niger* "*bordarii*" (probably from the Saxon *bord*, a cottage), and these cottagers, possessing generally no oxen, and therefore taking no part in the common plowing, still in some manors seem to have ranked as a lower grade of *villani*, having small allotments in the open fields, in some manors five-acre strips apiece, in other manors more or less. Lastly, below the *villani* and *cottiers* were, in some districts, remains, hardly to be noticed in the later cartularies, of a class of *servi*, or slaves, fast becoming merged in the *cottier class* above them, or losing themselves among the household servants or laborers upon the lord's demesne. (See *bohm*.) (See *manor, yard-land, heriot*.) It frequently happened that lands held in villenage descended in uninterrupted succession from father to son, until at length the occupiers or *villani* became entitled, by prescription or custom, to hold their lands against the lord so long as they performed the required services. And although the *villani* themselves acquired freedom, or their land came into the possession of freemen, the *villain services* were still the condition of the tenure, according to the custom of the manor. These customs were preserved and evidenced by the rolls of the several courts-baron in which they were entered, or kept on foot by the constant immemorial usage of the several manors in which the lands lay. And as such tenants had nothing to show for their estates but the entries in those rolls, or copies of them authenticated by the steward, they at last came to be called *tenants by copy of court-roll*, and their tenure a *copyhold*.

The burden of *villanage* in England had not been heavy even under the Norman rule, when the ceorl had under the shadow of his master's contempt retained many of the material benefits of his earlier freedom. But the English ceorl had had slaves of his own, and the Norman lawyer steadily depressed the ceorl himself to the same level. The ceorl had his right in the common land of his township; his Latin name *villanus* had been a symbol of freedom; but his privileges were bound to the land, and when the Norman lord took the land he took the *villain* with it. Still the *villain* retained his customary rights, his house and land and rights of wood and hay; his lord's demesne depended for cultivation on his services, and he had in his lord's sense of self-interest the sort of protection that was shared by the horse and the ox. Law and custom, too, protected him in practice more than in theory. So *villanage* grew to be a base tenure, differing in degree rather than in kind from socage, and privileged as well as burdened. Stubbs, *Const. Hist.*, § 264.

Cf. *fiddle*, prob. a doublet of *viol*. Hence *violin*, *violoncello*, etc.] 1. A musical instrument with strings, essentially not greatly different from the lute and the guitar, except that the strings are sounded by means of a bow drawn across them, not by plucking them with the fingers. The viol is the typical representative of a very large, varied, and widely distributed class of instruments, of which in modern music the violin is the chief member. The type includes the following characteristics: a hollow resonance-box or *body*, made up of a front or *belly* (which is pierced with one or two *sound-holes* of varying shape), a *back* (both front and back being flat or only slightly arched), and *sides* of various contour according to the particular variety and the period; within the body an internal system of braces, including a *sound-post*, to withstand the strain of the strings and to give the tone greater sonority; a more or less elongated *neck*, often with a special *finger-board* in front, and surmounted by a *head*, part of which serves as a *peg-box*; several strings, mostly of gut, fastened at the bottom either to the body directly or to a *tail-piece*, stretched thence over a *bridge* and over the finger-board and neck, and fastened at the top to *pegs* by which their tension and tune can be adjusted; and a *bow* for sounding the strings, consisting of a stick or back of wood and a large number of horse-hairs whose friction is augmented by the application of rosin. The differences between different instruments of the family in shape, size, number and tuning of strings, and method of manipulation are very numerous and apparently important; but the essential similarity between all the varieties is greater than is commonly thought. The historic genesis of the typical idea of the viol is disputed. By some its origin is asserted to be found in the gradual development, with the addition of sounding by means of a bow, of the ancient lyre into the monochord and the vielle, with various incidental modifications in shape and adjustment. By some its precursor is thought to be the Oriental rebab, or some similar instrument, transplanted into southern Europe, and modified by contact with the traditions of the lyre and monochord. By others great historic importance is attached to the Celtic crowd of western Europe. The problem is greatly complicated by the confusing use of terms in the middle ages, the same name being given to quite distinct instruments, and the same instrument being known by two or three different names. Apparently, also, somewhat distinct lines of development went on simultaneously in Italy, in Germany, and in western Europe. Probably the medieval viol, which reached its most distinctive development in the fifteenth century, was the joint result of several more or less distinct tendencies. It was characterized by a flat back, from five to seven strings tuned in fourths and thirds, a broad, thin neck, and a close amalgamation of the neck with the body. This viol was made in several sizes. The smallest (*treble* or *descant viol*) passed over later into the modern *violin*; the next larger (*tenor*), into the *viola da braccio* and *viola d'amore* and the modern *viola*; the next (*bass*), into the *viola da gamba* and the modern *violoncello*; and the largest (*double-bass*), into the *violone* and the modern *double-bass viol*.

viola¹ (vī-ō-lī'ā or vī'ō-lī'ā), *n.* [*L. viola*, *a. viol*: see *viol*.] 1. Same as *viol*.—2. Specifically, in modern usage, the large violin, properly the alto violin, though generally called the *tenor*, in size about one seventh larger than the violin. It is provided with four strings tuned in fifths, thus: A, D, G, and C (next below middle C), the two lower strings being wound with silver wire. The viola was probably the first member of the modern string quartet to be developed. Its tone is not so brilliant or varied as that of the violin, though susceptible of a peculiar pathetic quality under the hand of a good player, while in concerted music it is highly effective. Music for the viola is usually written in the alto clef. Also called *alto*, *tenor*, *bratsche*, *quint*, and *taille*.—**Viola bastarda**, a bass viol, or viola da gamba, mounted with sympathetic strings like a viola d'amore; a barytone. See *barytone*, *n.*, 1 (b).

The original viola da gamba when so strung came to be called the *viola bastarda*. *Encyc. Brit.*, XXIV, 244.

Viola da braccio, a tenor or "arm" viol: so called to distinguish it from the *bass viol*, or *viola da gamba*. It had properly six strings, tuned thus: G, D, A, F, C, and G (the second below middle C), but the lowest string was omitted in the eighteenth century. It has been superseded by the modern viola. Also *viola da spalla*.—**Viola da gamba**. (a) A bass or "leg" viol: so called to distinguish it from the *viola da braccio*. It had properly six strings, tuned thus: D, A, E, C, G, and D (the second below middle C). It has been superseded by the modern violoncello.

The division or solo bass viol, usually known by its Italian name of *viola da gamba*.

Viola da Gamba. (From Harl. MS.)

(b) In *organ-building*, a stop with metal pipes of narrow scale and ears on the sides of the mouths, giving tones of a penetrating, string-like quality.—**Viola d'amore**, a kind of bass viol, common in the seventeenth and eighteenth centuries, having usually seven ordinary gut strings, with from seven to fourteen (or even twenty-four) supplementary strings of metal under the finger-board which sound sympathetically. The gut strings were usually tuned thus: D, A, F², D, A, F², D (next below middle C). The sympathetic strings, if few, were tuned diatonically in the scale of D, or, if many, chromatically. The tone of the instrument was highly attractive, but the practical difficulties entailed by the numerous sympathetic tones were great, and prevented its use in the orchestra. Also called *viola*, and sometimes *English viola*.

Instruments which show these innovations are the *quinton*, the *lyre*, and the *viola d'amore*.

Encyc. Brit., XXIV, 243.

Viola da spalla. Same as *viola da braccio*.—**Viola di bordone**. Same as *barytone*, 1 (b).—**Viola di fagotto**. Same as *viola bastarda*.—**Viola pomposa**, a species of *viola da gamba*, invented by J. S. Bach, having five strings, tuned thus: E, A, D, G, C (the second below middle C).

Viola² (vī'ō-lī'ā), *n.* [*NL.* (Rivinus, 1699, earlier in Brunfels, 1530), *L. viola*, violet: see *violet*.]

A genus of plants, type of the order *Violariæ* and tribe *Violæ*, including the pansies and violets. It is characterized by flowers with nearly equal sepals, these and the lower petal both prolonged at the base, the latter into a spur or sac, and by an ovoid or globose three-valved capsule with roundish seeds. Over 250 species have been enumerated, perhaps to be reduced to 150. They are herbs or undershrubs with alternate leaves, persistent stipules, and axillary peduncles. The north temperate species are typically, as in *V. odorata*, delicate plants of moist shady banks, with rounded crenate leaves on long angular stalks, solitary nodding violet-colored flowers, five orange-yellow anthers forming a central cone, and ovate capsules which open elastically into three boat-like persistent horizontal valves. The stipules are usually conspicuous, often large and leaf-like, as in *V. tricolor*, the pansy, deeply pinnatifid and often larger than the leaves. (See first cut under *leaf*.) The leaves are of various forms, as cordate, arrow-shaped, lanceolate, rounded, pedate, etc. The peduncles often bear two flowers, as in *V. bicolor*, the twin-flowered violet, a saxicole species with brilliant golden-yellow flowers, found from the Alps to Cashmere and in the Rocky Mountains. The petals are colored, most often in shades of bluish-purple, white, or yellow, frequently penciled with dark-blue or purple lines. In some species they are of several colors, as in *V. pedata*, var. *bicolor*, the pansy-violet, or velvet violet, and in *V. tricolor*, which in its wild state, the heart's-ease, combines purple, yellow, and blue. Many species are dimorphic in their flowers, producing through summer minute apetalous ones which are more fertile and are self-fertilized, a fact first observed by Linnæus in the small mountain species *V. nivalis*. In some, as *V. Chamissoniana*, the common Hawaiian violet, the later flowers, though minute, are well developed and petal-bearing. There are 22 species in Canada and over 30 in the United States, of which 17, besides 2 or 3 introduced, occur in the North-eastern States, and 16 in the Southern, where they diminish southward, only 4 extending into Texas. The native American species are distinguished into two groups, the stemless violets, chiefly eastern or central, as *V. pal-*

mata, in which the long-stalked leaves are clustered at the top of a thick fleshy rhizome, which also bears the numerous distinct leafless scapes; and the leafy-stemmed species, as *V. canina* and *V. striata*, with spreading or somewhat erect stems bearing numerous leaves, usually on shorter petioles (see cut under *violet*). Several species produce long runners, as *V. blanda*, the sweet white violet; *V. Canadensis*, the largest, reaches sometimes 2 feet high; and *V. pedata*, the largest-flowered, has the flowers sometimes nearly 2 inches across. The 13 Californian species are chiefly leafy-stemmed, showy, quite local, and peculiar in their yellow flowers with purple veins and brown backs: *V. pedunculata*, the common species, grows in clustered colonies, with flowers often an inch and a half across; *V. ocellata* of the Mendocino forests is remarkable for its purple spots. *V. Langsdorffii* is abundant on the Aleutian Islands, and the genus extends north to Kotzebue Sound. The British species are 6, of which *V. odorata*, also occurring from central Europe to Sweden, Siberia, and Cashmere, is the sweet or English violet, often doubled, and called *tea-violet* in cultivation; and *V. canina* is the dog- or hedge-violet, without odor, but graceful in form, imparting much of the beauty of spring to English mountain districts. There are 56 species in Europe, over 20 in China, of which *V. Patrinii* is the most common, and 11 in the mountains of India. In the southern hemisphere, where the species are usually shrubby, there are over 30 in the mountains of South America, elsewhere few, 4 in Australia, of which the chief is *V. hederacea*, 2 in New Zealand, and 2 in Cape Colony. Five peculiar species occur in the Hawaiian Islands, of which *V. robusta* produces a woody stem sometimes 5 feet high, and *V. helioscopia* a large snow-white waxy flower sometimes 2 inches across. A few somewhat shrubby species occur northward, as *V. arborescens*, the tree-violet, *V. scandens* of Peru is a climbing and *V. arguta* a twining shrub; *V. decumbens* of Cape Colony, a much-branched proeminent shrub; *V. filicaulis* of New Zealand, a smooth, slender mountain-creep. The pansy and other species are of some medicinal use. For *V. tricolor*, see *pansy* and *heart's-ease* (its small form is known in the United States as *Johnny-jump-up* and *lady's-delight*). For other species, see *violet*.

It inhabits equatorial Africa. *M. violacea* was so named by Isert in 1789, when the genus was instituted, and is the *touraco violet* ou *marqué* of Levaillant, 1806; *M. rossæ* was named by Gould in 1851.

It is characterized by flowers usually with five petals, five sepals, and as many perfect stamens; by anthers nearly or quite connate around the pistil, introrsely dehiscent, and commonly with an appendaged connective; and by a one-celled ovary, commonly with three placentæ and a me-

dium-sized embryo in fleshy albumen. There are over 270 species, belonging to 25 genera, classed in 4 tribes, of which the types are *Viola*, *Pappayrola*, *Absochia*, and *Sauvagesia*, the last being aberrant in the presence of stamnodes. With the exception of the genus *Viola*, they consist chiefly of tropical shrubs with deciduous stipules, sometimes small trees, and mostly with but few species in each genus. They usually bear alternate simple entire or toothed leaves, and axillary flowers which are solitary, or form racemose or panicle cymes, followed by capsules which are commonly loculicidal. Their roots often have emetic properties, and in South America many species, especially of *Ionidium*, are used as substitutes for ipecacuanha. The order is largely American, two genera, *Viola* and *Ionidium*, occur within the United States. Also *Violaceæ*.

2. A general class of colors, of which the violet-flower is a highly chromatic example. In the spectrum the violet extends from *h* to *ii*, covering all the upper part of the spectrum ordinarily visible. This color can be produced by a slight admixture of red to blue; and colors somewhat more red than the upper part of the spectrum are called violet. But the sensation of violet is produced by a pure blue whose chroma has been diminished while its luminosity has been increased. Thus, blue and violet are the same color, though the sensations are different. A mere increase of illumination may cause a violet blue to appear violet, with a diminution of apparent chroma. This color, called violet or blue according to the

quality of the sensation it excites, is one of the three fundamental colors of Young's theory. It is nearly complementary to the color of brightness, so that deep shades generally appear by contrast of a violet tinge; and the light of a rainy day, and still more of a sudden tempest, has a violet appearance. Even the pure yellow of the spectrum, so reduced as to be barely visible, looks violet beside the same light in great intensity.

violin¹ (vi'ô-lin'), n. [= Sp. *violín* = Pg. *violino* = G. *violine* = Sw. *dan. violin*, < It. *violino*, dim. of *viola*, a viol; see *viol*. Cf. F. *violon*, a violin.] 1. The modern form of the smaller medieval viola da braccio. The violin group of instruments is distinguished from the true viols especially by having the back slightly arched like the belly, and by the number and tuning of the strings. It is probable that the change from the viol model was first made in the tenor viol, or *viola*, and thence transferred to the smaller size, or *violino*. The true violin, both large and small, began to be made about the middle of the sixteenth century, particularly in the North Italian towns of Cremona and Brescia. The greatest refinement of shape and construction was attained about 1700 by Stradivari, and has never since been surpassed. In its most approved form, the violin is further distinguished from the viol by a comparative thinness between belly and back, by sides or ribs of a peculiar shape, by bouts (indentations in the sides to facilitate the use of the bow) between double corners, by a finely adjusted correlation of position between the bridge, the sound-post, and the f-shaped sound-boards, by the complete independence of the neck from the body, by a peg-box with transverse pegs, and by a daintily

carved scroll for a head. Four strings are used, tuned thus: E, A, D, and G (next below middle C), of which the lowest is wound with silver wire, while the others are of gut. The first string is often called the *chanterelle*. In

A, scroll; B, pegs; C, peg-box; D, upper saddle; E, finger-board; F, sound-holes; G, bridge; H, tail-piece; I, tail-piece ring; K, tail-piece button; M, neck-plate; N, neck-plate; O, back; P, front or belly; R, R, bouts; S, waist. Inside the violin has six blocks (namely, neck-block, end-pin block, and four corner-blocks), twelve hoop-linings, a bass-bar, and a sound-post.

the construction of the instrument maple and pine, very carefully selected, are the chief components. The minutest details of wood, model, jointing, varnish, etc., are important, so that a really fine instrument is an elaborate work of art. The bow by which the violin is sounded has also been gradually refined in shape, so as to present the utmost strength, elasticity, and lightness (see *bow*, 3 (a)). In actual use the violin is held nearly horizontally by the player's extended left arm, the lower part of the body being supported on his left collar-bone. The first position of his left hand is so close to the nut that the pressure of the first finger on any one of the strings will raise its pitch a half-step, that of the second finger will raise it a whole step, etc. The second position, or half shift, is one in which the first finger falls where the second did in the first position. The third position, or whole shift, is one in which the first finger falls where the second did in the second position. (See *position*, 4(c), and *shift*, 2.) Eleven different positions are recognized, so that the compass of the instrument, which in the first position extends only to two octaves and a major third, reaches by means of other positions to nearly four octaves. Harmonics are producible by lightly touching a string at one of its nodes, so that the available compass is still longer. The tone of the violin is more capable of expression than that of any other instrument; hence it holds the leading position in the modern orchestra, the central section of which is made up of the first and second violins, the violas, and the violoncellos, all of which are essentially violins in model. It is also a favorite instrument for solos, both with and without accompaniment. While the pitch of the tones used is determined by the stopping of the strings with the left hand, their force and quality—that is, their expressiveness—depends on the method of bowing. To a certain extent, two or even three strings may be sounded together, so as to produce harmonic effects: such playing is called *double-stopping*. *Pizzicato* tones are produced by plucking the strings with the finger, after the manner of the guitar. A peculiar veiled tone is obtained by attaching a weight called a *mute* or *sordino* to the bridge so as to check its vibrations. The violin is often colloquially called a *fiddle*.

violoncello (vê'ô-lon-chel'ô or vi'ô-lon-sel'ô), n. [It., dim. of *violone*, q. v.] 1. The modern form of the medieval viola da gamba. It is properly a bass viol rather than a small violone, as its name suggests, since its form is that of the violin rather than of the true viol. Its size is about double that of the violin. It began to be popular for concerted music early in the seventeenth century, and for solo use about a century later. Its four strings are tuned thus: A, D, G, C (the second below middle C), the third and fourth being silver strings. In playing, the violoncello is rested vertically by means of a wooden peg or standard on the floor between the player's knees. The method of playing is otherwise very similar to that of the violin, including the same special effects. The tone is very sonorous and expressive, combining the advantages of the violin tone with the breadth of a tenor compass. The bow used is similar to that for the violin, but larger. In modern music the violoncello stands next in importance, among the stringed instruments, to the violin, both as a member of the orchestra and as a solo instrument. Commonly abbreviated *cello*, *cello*.

2. In organ-building, a pedal stop of eight-feet tone, having metal pipes of narrow scale and a very string-like quality.—**Violoncello piccolo**, a small or miniature violoncello, having the same proportions and tuning. It was used especially for solos.

It was originally a very large viola da gamba, sometimes provided with six strings, but usually with only three or four. The three-stringed form was tuned thus: G, D, A (the third below middle C), which is the tuning of the modern three-stringed double-bass, with which the violone is nearly identical.

2. In organ-building, a pedal stop of sixteen-feet tone, resembling the violoncello.

A venomous snake of the family *Viperidæ*: originally and especially applied to the only serpent of this kind occurring in the greater part of Europe, *Vipera communis* or *Pebas berus*. This is the only poisonous reptile which is found in Great Britain, and there it is neither very common nor very dangerous. There are several genera and many species of vipers properly so called, all Old World, chiefly of warm countries, all poisonous, and most of them very dangerous if not fatal: they are known indifferently as *vipers*, *asps*, or *adders*. See *Viperidæ*, and cuts under *adder*, *Cerastes*, and *doboya*.

form serpent, as a cobra, asp, or adder; also, loosely, any serpent that is venomous, or supposed to be so; a dangerous, repulsive, or ugly snake. In the United States the name is commonly but erroneously applied to various spotted snakes, especially to some supposed to be venomous, but in fact innocuous: as, the water-viper, *Aneides piscivorus*, the water-moccasin, poisonous; the blowing-viper and black viper, *Heterodon platyrhinos* and *H. niger*, both harmless, though of formidable and repulsive aspect. virelay (vir'ĕ-lā), *n.* [*F. virelai*, < *vire*, turn, change direction (see *verr*), + *lai*, a song, lay; see *lay*.] An old French form of poem, in short lines, running on two rimes; also, a succession of stanzas on two rimes, and of indeterminate length, the rime of the last line of each becoming the rime of the first couplet in the next, thus: *a, a, b, a, a, b, a, a, b; b, b, c, b, b, c, b, c; c, c, d, c, c, d, e, c, d; etc.* In a nine-line lay the rime-order is as follows: *a, a, b, a, a, b, a, a, b*. The *virelai nouveau* is written on two rimes throughout; and the lines of the first couplet reappear alternately at irregular intervals throughout the poem, concluding it in reverse order. No rime should be repeated. [This form has been written in English but sparingly. Except by example, it is difficult to explain it. Here is the beginning of one:

Good-bye to the Town!—good-bye!
Hurrah! for the sea and the sky!

In the street the flower-girls cry;
In the street the water-carts ply;
And a fluter, with features a-wry,
Plays fitfully, "Scots, wha hae!"—
And the throat of that fluter is dry;
Good-bye to the Town!—good-bye!

And over the roof-tops high
Come a waft like a dream of the May,— etc.

The next paragraph closing with:

Hurrah! for the sea and the sky!

Vireo (vir'ĕ-ō), *n.* [NL., < *L. vireo*, a kind of bird, a greenfinch.] 1. A genus of small greenish oscine or singing passerine birds of America, the type of the family *Vireonidae*, and including most of the species of that family; the greenlets. See *Vireonidae*, and cuts under *greenlet* and *solitary*.—2. [*l. c.*] A greenlet; any bird of the family *Vireonidae*, especially of the genus *Vireo*.—**Arizona vireo**, the gray vireo. *Baird*, *Brewer*, and *Ridgway*, 1874.—**Bell's vireo**, *V. belli*, a very small greenlet of the United States from Illinois westward, and south into Mexico, discovered by Audubon on the upper Missouri, and named by him in 1844 after John Bell, a New York taxidermist.—**Black-capped or black-headed vireo**, *V. atricapillus*, a rare and remarkable greenlet found from Texas to Mazatlan and southward, first described by Dr. S. W. Woodhouse in 1852 from specimens he procured on the San Pedro river. It has the cap jet-black, unlike any other vireo.—**Black-whiskered vireo**, one of the mustached greenlets, *V. barbatulus*, of Florida and the West Indies. See *whip-tom-kelly*.—**Blue-headed vireo**, the solitary vireo, whose cap is somewhat bluish, in contrast with the greenish of the other upper parts.—**Cassin's vireo**, the western variety of the solitary vireo. *Xantus*, 1859.—**Gray vireo**, *V. vicinior*, an isolated species discovered in Arizona by Coates in 1864.—**Hutton's vireo**, *V. huttoni*, a relative of the white-eye, found in California and Mexico. *Cassin*, 1851.—**Lead-colored vireo**, the plumbeous vireo. *Baird*, *Brewer*, and *Ridgway*, 1874.—**Least vireo**, *V. pusillus*, a very small greenlet discovered by Coates in 1864 in Arizona, and related to the gray and Bell's vireos.—**Mustached vireo**, one of several of the larger species which have maxillary streaks, especially the black-whiskered, or whip-tom-kelly.—**Philadelphia vireo**, the brotherly-love greenlet, discovered by John Cassin near the city of that name, and originally described by him in 1851 as *Vireosylva philadelphia*. It belongs with the red-eye in the slender-billed section of the large vireos, but in coloration is almost identical with the warbling vireo. It inhabits eastern parts of North America, north to Hudson's Bay, and extends to Guatemala in winter. It is more abundant in the Mississippi watershed than where originally found.—**Plumbeous vireo**, *V. plumbeus*, of the southern Rocky Mountain region and southward, discovered by Coates in Arizona in 1864. It resembles the solitary greenlet, but is much duller in color; the length is 6 inches.—**Red-eyed vireo**, the red-eye (which see, with cut). Also called *red-eyed flycatcher* (after Catesby, 1771, Latham, Pennant, etc.), and formerly *blue-colored flycatcher* (Edwards).—**Solitary vireo**. See *solitary*.—**Vigors's vireo**. Same as *Vigors's warbler* (which see, under *warbler*).—**Warbling vireo**, *V. gilvus*, of all temperate eastern North America and southward. It is one of the smaller species, about 5 inches long and 3½ in extent, and very plainly colored; it inhabits high woodland, and has an exquisitely melodious warble, often heard from the shade and ornamental trees of parks and cities.—**White-eyed vireo**, *V. noveboracensis* (formerly *Muscivora noveboracensis*, *V. cantatrix*, *V. muscivora*, etc.), a small stout-bodied greenlet notable for the brightness of the olive parts, the richness of the yellow about the face and eyes and along the sides, and especially the white iris. It is scarcely 5 inches long and 8 in extent; it inhabits the

the plumed vipers, or puff-adders, as *C. arietans* of Africa; *Echis* of Merrem, called *Toxica* by Gray; and *Atheris* of Cope, also called *Poecilostolus*. In the two latter the urostegea are single-rowed; in the rest, two-rowed. The generic distinctions of the first five are slight, chiefly resting upon the formation of the plates about the nostrils. See also cuts cited under *viper*, 1.

viperiform (vī'pĕr-i-fōrm), *a.* [*L. vipera*, a viper, + *forma*, form.] Having the form or structure of a viper; allied or belonging to the vipers: correlated with *cobriform* and *crotaliform*.

notes, and hangs its nest in a low bush. Scraps of newspaper usually enter into this fabric, whence the white-eye was nicknamed "the politician" by Wilson. This is one of the longest- and best-known of its family, and was known to the earlier ornithologists as the *green flycatcher* (Pennant), *hanging flycatcher* (Latham), *green wren* (Bartram), etc. White-eyed vireos, like Maryland yellowthroats and summer yellowbirds, are among the most frequent foster-parents of the cowbird. Also called *white-eyed greenlet*.—**Yellow-green vireo**, *V. flavoviridis*, a near relative of the red-eye and whip-tom-kelly, but yellower, of Mexico and over the United States border.—**Yellow-throated vireo**. They have a hooked bill, rictal bristles, ten primaries, scutellate tarsi, and toes coherent at the base. They are all small birds, under 7 inches long, of simple and mostly greenish coloration, and are confined to America, where they are migratory in the northern parts. The genera are *Vireo*, specially characteristic of North America, containing some 30 species in its several sections, with *Laetes*, *Cycularhis*, *Hylophilus*, *Vireolanus*, and *Neochlos*, and probably *Dulus* and *Phaenicothais*. *N. brevipennis* is a Mexican type; *L. osburnii* is peculiar to Jamaica. The *Vireonidae* are remarkable in possessing either ten, or apparently only nine, primaries in closely related forms, owing to the variable development of the spurious first primary, which is sometimes quite rudimentary. The species of *Vireo* are insectivorous, and inhabit woodland and shrubbery, have an earnest and voluble, often highly melodious song, weave pensile nests, and lay spotted eggs. See the phrase-names under *Vireo*, and cuts under *Dulus*, *Hylophilus*, *red-eye*, *solitary*, *Vireo*, and *whip-tom-kelly*.

Virgo (vēr'gō), *n.* [NL., *< L. virgo*, maiden; see *virgin*.] An ancient constellation and sign of the zodiac.

The figure represents a winged woman in a robe holding a spike of grain in her left hand. One of the stars was called *Vindemiatrix*, or by the Greeks *Protrygeter*—that is, precursor of the vintage. At the time when the zodiac seems to have been formed, 2100 B. C., this star would first be seen at Babylon before sunrise about August 20th, or, since there is some evidence it was then brighter than it is now, perhaps a week earlier. This would seem too late for the vintage, so that perhaps this tradition is older than the zodiac. Virgo appears in the Egyptian zodiacs without wings, yet there seems no room to doubt that the figure was first meant for the winged Assyrian Astarte, especially as the sixth month in Accadian is called the "Errand of Istar." The symbol of the zodiacal sign is ♍, where a resemblance to a wing may be seen. The constellation contains the white first-magnitude star Spica. See cut in next column.

virtual (vēr'tū-äl), *a.* [= *F. virtuel* = *Sp. Pg. virtual* = *It. virtuale*, *< ML. virtialis* (*Duns Scotus*), *< L. virtus*, strength, virtue: see *virtue*.] 1. Existing in effect, power, or virtue, but not actually: opposed to *real*, *actual*, *formal*, *immediate*, *literal*.

Shall this distinction be called real? I answer, it is not properly real actual in the sense in which that is commonly called real actual which is a difference between things and in act, for in one person there is no difference of things on account of the divine simplicity. And as it is not real actual, so it is not real potential, for nothing is there in power which is not in act. But it can be called . . . a virtual difference, because that which has such a distinction in itself has not thing and thing, but is one thing having virtually or eminently, as it were, two realities, for to either reality, as it is in that thing, belongs the property which is in such reality as though it were a distinct thing; for so this reality distinguishes and that does not distinguish, as though this were one thing and that another.
Duns Scotus, *Opus Oxoniense* (trans.), I. ii. 7.

[This passage is given as affording perhaps the earliest example of the word in Latin.]

Sir M. Hale, *Knowledge of Christ Crucified*.

3. In *mech.*, as usually understood, possible and infinitesimal: but this meaning seems to have arisen from a misunderstanding of the original phrase *virtual velocity*, first used by John Bernoulli, January 26th, 1717, which was not clearly defined as a velocity at all, but rather as an infinitesimal displacement of the point of application of a force resolved in the direction of that force. The principle of virtual velocities is that, if a body is in equilibrium, the sum of all the forces each multiplied by the virtual velocity of its point of application is, for every possible infinitesimal displacement of the body, equal to zero. The epithet appears to have been derived from an older statement that when, by means of any machine, two weights are brought into equilibrium, the velocities are inversely as the weights; so that virtual would here mean practical, as in def. 1.—**Virtual coefficient**.—**Virtual cognition** (*notitia virtualis*), the implicit existence in the mind of a concept as part of another, without special attention to this secondary concept. The term is due to *Duns Scotus*.—**Virtual difference**.—**Virtual displacement**, an infinitesimal arbitrary displacement, essentially the same as a virtual velocity.—**Virtual focus**, in *optics*, a point at which the lines of a pencil of rays would meet if sufficiently produced, although the rays themselves do not actually reach it. See *focus*. 1.—**Virtual head**.—**Virtual image**, in *optics*, an apparent image; an image which has no real existence. See *under lens*, *mirror*.—**Virtual moment of a force**. See *moment*.—**Virtual monopoly**. See *monopoly*.—**Virtual quantity**. Same as *intensive quantity* (which see, *under intensive*).—**Virtual resistance**. See *resistance*, 3.—**Virtuality**. 2. In *physics*, internal friction, a resistance to the motion of the molecules of a fluid body among themselves; opposed to *mobility*. Thus, the viscosity of such liquids as pitch and syrup is very great as compared with that of a mobile liquid like alcohol. A slow continuous change of the shape of solids or semisolids under the action of gravity or external force is also, by extension of the name, called *viscosity*: as, the *viscosity* of ice. Viscosity is proportional to the relative velocity of strata at a unit distance. The viscosity of gases and vapors is due to the molecules shooting from one stratum to another carrying their vis viva with them. The viscosity of liquids arises from an entirely different cause, namely, from the mutual attractions of the molecules, and is diminished by the effect of the wandering of the molecules. Consequently, the viscosity of gases increases while that of liquids diminishes as the temperature is raised.

Hence, if we attempt to cause one stratum of gas to pass over another in parallel planes, we experience a resistance due to the interchange of molecules between the portions of gas separated by the plane. This is in some respects analogous to sliding friction between solid bodies, and is called by German writers the "friction" (Reibung), by Maxwell and others the "viscosity" of the gas.

Encyc. Brit., XVI. 619.

The *viscosity* of liquids presents a certain analogy with the malleability of solids.

Vishnu is sometimes represented as riding on Garuda, a being half bird and half man; as holding in one of his four hands a conch-shell blown in battle, in another a disk as emblem of supreme power, in the third a mace as the emblem of punishment, and in the fourth a lotus as a type of creative power.

It is also known as *Ampelidææ* (Kunth, 1821), or now as *Ampelidaceæ* (R. T. Lowe, 1857), and as the *vine family*—in each case from its type, *Vitis vinifera*, the *αἰτιαλός* of the Greeks. The order is characterized by a small calyx with imbricated lobes, and valvate caducous petals with the stamens opposite them. There are about 435 species, of which 44 species, principally of Asia and Africa, forming the genus *Leea*, are erect tropical shrubs or small trees, with pinnate leaves without tendrils. The others, classed in 10 genera, and forming the tribe *Ampelidææ*, are shrubby tendril-bearing climbers or vines, with a copious watery juice, round, angled, or irregular stems (thickened at the nodes (rarely herbaceous or subterranean), their wood abounded in large dotted ducts. They bear alternate or petioled leaves, which are simple, lobed, or digitately divided into three to five leaflets. The inflorescence is paniculately cymose or racemose, rarely spicate, and is developed opposite the leaves; the peduncles end in simple or divided tendrils. The small flowers are commonly greenish or inconspicuous. The fruit is a roundish juicy berry, commonly one-celled by obliteration of the two to five partitions, and containing two to five seeds. It is often large, sweet, and edible in *Vitis* and *Cissus*, or sometimes acid, astringent, or intensely acid. Three genera extend into the United States, *Vitis*, *Cissus*, and *Ampelopsis*.

Ampelocissus, *Parthenocissus*, and *Tetragonia* also occur in tropical America; the others are small genera of the Old World. Their leaves are astringent, and sometimes furnish domestic remedies, especially those of tropical species of *Cissus*; another furnishes a blue dye; but the principal importance of the family is the production of grapes and wine. *Periantheæ*, a small aberrant genus, is one of the most singular of plants in its inflorescence, bearing its innumerable small flowers on a thin, flattened wing-like or leaf-like receptacle forming the expanded end of a slender tendril.

vitastroscope (vī'ta-skōp), *n.* [*< L. vita, life, + Gr. σκοπεῖν, view.*] An apparatus, based on the principle of the zoëtrope, for projecting a great number of pictures of the same object in rapid succession upon a screen, thus producing the appearance of motion. *Cinematograph, electro-scope, kinographoscope, and veriscope* are names applied to various machines essentially like the vitastroscope.

The *vitastroscope*, a far more complicated and powerful structure [than the kinetoscope], takes this same ribbon which has been prepared by the kinetoscope, and coils it up on a disc at the top of the machine, from which it is passed over a system of wheels and through a narrow upright clamp-like contrivance that brings it down to a strong magnifying lens, behind which there is an electric burner of high capacity. The light from this carbon burner blazes fiercely through the translucent ribbon, and projects the images on the negatives there, blended, to a distant screen, with great clearness, for the benefit of the audience.

Vitex (vī'teks), *n.* [*NL. (Rivinus, 1690), < L. viter, agnus castus.*] A genus of plants, of the order *Verbenaceæ*, type of the tribe *Viticeæ*. It is characterized by medium-sized flowers, the corolla with a short tube and very oblique five-lobed or two-lipped limb (its forward lobe larger), by four usually exerted stamens, and by a drupeaceous fruit with a single four-celled nutlet. There are about 75 species, widely dispersed throughout warm regions, a few extending into temperate parts of Asia and southern Europe. They are trees or shrubs bearing opposite leaves, which are commonly composed of three to seven digitate entire or toothed thin or coriaceous leaflets.

The flowers are white, blue, violet, or yellowish, and form cymes which are loose and widely forking, or short, dense, and sometimes almost contracted into a head. The genus is somewhat aromatic; several species are tender shrubs cultivated under glass. *V. Agnus castus*, a deciduous shrub from Sicily and the Mediterranean, is cultivated in many forms, as with variegated leaves, etc., under the names *chastetree, Abraham's-balm, hemp-tree, monk's pepper-tree*, and especially *agnus castus* (which see, under *agnus*). *V. trifolia* is known in India as *wild pepper*. *V. pubescens* (*V. arborea*) of the East Indies is an evergreen reaching 50 feet in height, known as *tree-vitex*. Many species produce a valuable wood, as *V. lignum-vitæ*, the lignum-vitæ of Queensland, and *V. capitata*, the bois lézard of Trinidad, Guiana, and Brazil, or a durable building-timber, especially *V. bitortalis*, the New Zealand teak or puriri, which is considered indestructible in water. The last is a large tree sometimes 5 feet in diameter, bearing spreading branches of dull-red hairy flowers an inch long. Vitis (vī'tis), *n.* [NL. (Malpighi, 1675); earlier by Brunfels, 1530], < L. *vitis*, a vine, < *vicere* (< *vi*), twist, wind; see *withy*, *withy*. Hence (< L. *vitis*) ult. E. *cise*.] A genus of plants, in-

cluding the grape, type of the order *Vitaceæ* or *Ampelidaceæ*. It is characterized by polygamodiceous flowers, each with a cap of 5 coherent caducous petals. From *Cissus*, its tropical representative, it is further distinguished by its conical or thickened (not subulate) style; and from the other genera, as *Ampelopsis*, the common Virginia creeper or American ivy, by its pyriform seeds. There are about 30 species, natives of the northern hemisphere, chiefly within temperate regions. They are shrubby or climbing with simple or lobed leaves (rarely digitate, like *Ampelopsis*), and long branching tendrils produced opposite the leaves, and also from the flower-stalk. The inflorescence is a thyrsus of inconspicuous flowers, often very fragrant, usually greenish, and peculiar in the fall of the unopened petals without expansion. The fruit, a pulpy berry, is normally two-celled and with two to four seeds, to which the pulp adheres in the American, but does not in the one or two European species. By Planchon (1872) the genus is divided into two sections—*Euvitis*, with a peculiar thin brown fibrous bark which soon separates and hangs in shreddy plates; and *Muscadinia*, consisting of *V. rotundifolia* (*V. vulpina*), and the muscadine, and *V. Munsoniana*, the bird-grape of Florida, peculiar in their closely adherent punctate bark, nearly elliptical seeds, somewhat cymose inflorescence, and unbranched tendrils. The most important species, *V. vinifera*, is the vine of southern and central Europe, known in America as the *European*, *hot-house*, or *California grape*, native in Turkey, Persia, and Tataria, probably also in Greece and in the Himalayas, and now cultivated in the Old World from nearly 55° north to about 40° south latitude, sometimes up to the altitude of 3,000 feet. In England its fruit ripens in the open air only in favorable seasons, although in the eleventh and twelfth centuries an inferior wine was there made from it. It grows in all soils, but best in those which are light and gravelly. Some individuals in warm climates have attained in centuries a trunk 3 feet in diameter. In the United States the climate is not favorable to it, except in California. It is the source of thousands of varieties, obtained by propagation from seed. To continue the original variety in cultivation, propagation by layers, cuttings, grafting, or inoculation is practised. (See *vine* and *grape*, also *wine*, *raisin*, and *currant*.) The species are most abundant in the United States, there estimated by Munson at 23; they are especially numerous in Texas, which has 12 species, or 8 as recognized by Coulter. The eastern United States is thought richer in useful species than any other part of the world, 4 of the 8 Atlantic species having given rise to valuable cultivated varieties. Of these *V. Labrusca*, the common wild grape of the New England coast, extends from Canada through the Atlantic States to Tennessee, and from Japan to the Himalayas; it is the source of the Concord, Isabella, Catawba, Iona, Diana, and other grapes, and some claim that an Asiatic hybrid between it and *V. rotundifolia* was the original of *V. vinifera*. *V. bicolor* (formerly included with *V. aestivalis*), the blue or winter grape, occurs from New York to Wisconsin and southward; and *V. aestivalis*, the summer grape, from Virginia to Texas. From these come the Delaware and the most promising native American red-wine grapes, as the Cynthiana and Norton's Virginia. *V. riparia* (*V. palmata*), the river-grape, is widely distributed through all the Northern States and Canada to Colorado, and is the only Rocky Mountain species; in cultivation it is extensively used in France to supply phylloxera-proof stock for fine wine-producing varieties of *V. vinifera*. Many other valuable varieties have been formed from the American grapes by hybridizing with one another or with *V. vinifera*; these hybrids are in general proof against the phylloxera, and include by far the best American table-grapes. The fourth North Atlantic species, *V. cordifolia*, the frost-, chicken-, or possum-grape, ranges from New York to Iowa and the Gulf of Mexico, and is the most common of the 3 species of Canada. It produces small blackish or amber-colored fruit, sometimes used, after it has been touched by frost, for preserves. Among these species, *V. riparia* is readily distinguished by its leaves with a broad rounded basal sinus, and its growing tips enveloped with young undeveloped leaves, and *V. cordifolia* by leaves with both sides smooth and shining. The other three have the upper surface dark-green and more or less rugose; the lower in *V. bicolor* bluish with a bloom, in *V. aestivalis* dusty-doloucent, with short broad stipules, and in *V. Labrusca* densely white or rusty with close tomentum, with long cordate stipules. Their berries are mostly small—in *V. bicolor* and *V. aestivalis* apt to be astringent and white-dotted; those of *V. Labrusca* and *V. rotundifolia*, the fox-grapes, have a musky or foxy taste or odor (see *fox-grape*). The latter, the muscadine or bullace grape, the source of the scuppernon (which see), is the largest-fruited American species, and extends from Virginia to Texas, and from Japan to the Himalayas. Many other American species are quite local; 3 are confined to Florida, 7 mainly to Texas, as *V. candicans*, the mustang or cutthroat grape, and *V. monticola*, the sweet mountain grape; several others are nearly restricted to the Mississippi valley, as *V. cinerea*, the sweet winter grape, and *V. rubra*, an ornamental species. *V. Arizonica*, the canyon-grape of Arizona, and *V. Girardiana*, of southern California, are small-fruited species; *V. Californica*, the vauvee of the Indians, bears large clusters of purple fruit of rather pleasant flavor. *V. Caribæa* is the Jamaica grape or water-

with of the West Indies, Mexico, and Central America. The only other American species not found in the United States is *V. Blancana* of the Sierra Madre. A few species are peculiar to Asia, 5 to Japan, China, and India, *V. Ananensis* to Siberia. The numerous tropical and southern temperate species formerly ascribed to *Vitis* are now referred to *Cissus*, including 17 in Australia. Several in mountains of India and Java produce edible fruit; 3 extend within the southern United States, 2 in Texas—the shrub *V. bipinnata* (now *Cissus stans*) and the ornamental vine known as *yerba del buey*, *V. (C.) incisa*—and 1 in Florida, *V. (C.) sicyoides*, for which see *china-root* and *bastard bryony* (under *bryony*).

[The early editions read *autremite*, the Six Texts and Tyrwhitt read as here, and the Harleian MS. has *wytemyrmite*. Skeat conjectures that it means a 'glass head-dress', as contrasted with a helmet. Nothing as yet really satisfactory has been proposed.]

It. vitro*; < L. *vitreus*, of glass, < *vitrum*, glass, orig. **vitrum*, a transparent substance. < *videre*, see; see *vision*. Viverridæ (vi-ver'i-dë), *n. pl.* [NL., < *Viverra* + *-idæ*.] A family of carnivorous mammals, of the *aluroid* or feline series of the fissiped *Feræ*, typified by the genus *Viverra*. The family has been made to cover a miscellaneous assortment of animals, such as the coatis and bassarids of the New World, some of the *Mustelidæ*, the kinkajou (*Cercoleptes*), the *Cryptoproctidæ*, etc. Excluding all these, the *Viverridæ* constitute a natural and very extensive and diversified family of small cat-like or weasel-like carnivorous quadrupeds, digitigrade, or almost plantigrade, generally with long, low body, short legs, long and sometimes prehensile or curly tail, and long, sharp snout, and for the most part provided with peculiar anal glands secreting the substance called *civet* or a similar product. All the *Viverridæ* belong to the Old World, in the warmer parts of which their genera, species, and individuals abound. Their nearest relatives are the hyenas. In the *aluroid* series (see *Aluroidea*) the *Viverridæ* are distinguished by the number of their teeth, which are thirty-four to forty, there being on each side of the upper jaw two molars (exceptionally one), four premolars (exceptionally three), one canine, and three incisors; and on each side of the under jaw two molars, four premolars (exceptionally three), one canine, and three incisors; the upper molars and the back lower molar are tuberculate. The *Viverridæ* fall naturally into two main divisions, based primarily upon certain arch characters, and distinguished outwardly by the clawed toes and sharp retractile claws of the one section, as contrasted with the straight toes and blunt claws of the other; these are respectively styled *aluropod* or cat-footed, and *cympod* or dog-footed. The former is the *viverrine* section in strictness, the latter the *herpestine* section; each has several subfamilies. (a) To the *viverrine* section belong the typical civets and genets, forming the subfamily *Viverrinæ*; the prionodonts, *Prionodontinæ*; the galidians, *Galiduinæ*; the palm-cats or paradoxours, with curly tails, *Paradozurinæ*; the binturongs, *Arctictiduinæ*; the hemigales, *Hemigalinæ*; and the cynogales, *Cynogalinæ*. (See cuts under *civet-cat*, *Cynogale*, *Galidictis*, *genet*, *musang*, *nandine*, and *tangalung*.) (b) To the *herpestine* section belong the numerous ichneumonids, mongooses, etc., forming the restricted *Herpestinæ*, of which upward of 12 genera and many species are known; the cynictids, *Cynictiduinæ*; the *Rhinogalinæ*; and the suricates, *Crossarchinæ*. (See cuts under *Cynictis*, *ichneumon*, and *Suricata*.) In all, there are some 30 genera of *Viverridæ*, of 11 subfamilies of 2 sections. Besides furnishing the civet of commerce, the *Viverridæ* take the place of ordinary cats and weasels in destroying smaller vermin, and some of them are of the greatest service, owing to their destruction of venomous reptiles, crocodiles' eggs, etc.

De Blainville. The division is worthless, as some mammals are oviparous, and many of the lower vertebrates are viviparous, as are also some invertebrates. The name is a survival of the unitism from the time of Aristotle, the later *Vivipara* or *Zootoca* being the *ζωοτοκάρια ἐν αὐτοῖς* (mammals) of that author.

Bringing forth alive; having young which maintain vascular vital connection with the body of the parent until they are born in a comparatively advanced stage of development; reproducing by birth, not by hatching from an egg which is laid and afterward incubated: correlated with *oviparous* and *ovoviviparous*. See those words, and *egg*¹. In strictness, all metazoic animals and some protozoans are oviparous, since they produce ova; but the distinction subsists in the duration of the period in which the product of conception remains in the body of the parent. If the egg is quickly extruded, the animal is *oviparous*; if it is separated from the mother, but hatches inside the body, *ovoviviparous*; if it comes to term in a womb, *viviparous*. Among vertebrates, all

mammals excepting monotremes, no birds, many reptiles, and some fishes are viviparous. Invertebrates are mostly oviparous, in some cases ovoviviparous, in a few viviparous.

2. In *bot.*, germinating or sprouting from a seed or bud which is still on the parent plant. The term is also sometimes equivalent to *proliferous* as applied to grasses, rushes, sedges, etc. See *proliferation*, 2.

Vivisection strictly includes only cutting operations; but the term is extended to any physiological experimentation upon living animals, as a compression of parts by ligatures, subjection of the creature to special conditions of atmospheric pressure, temperature, and food, exhibition of poisons or other drugs, inoculation of disease, etc. Vivisection in competent and humane hands, under proper and reasonable restrictions, is fruitful of good results to the sciences of physiology and pathology.

The flowers are of two kinds—one bisexual, small, and pale; the other fertile and apetalous, lengthening, and pushing the young pod into the earth, in which it ripens like a peanut. It is cultivated from Bambarra and Guinea to Natal in Africa, and is now naturalized in Brazil and Surinam. = **Syn. I.** *Vocabulary*, *Dictionary*, *Glossary*, *Lexicon*, *Nomenclature*. A *vocabulary*, in the present use, is a list of words occurring in a specific work or author, generally arranged alphabetically, concisely defined, and appended to the text; whereas we generally apply the term *dictionary* to a word-book of all the words in a language or in any department of art or science, without reference to any particular work: thus, we speak of a *vocabulary* to Cesar, but of a *dictionary* of the Latin language, or of architecture, chemistry, etc. An exception to this may be where the words of an author are so fully treated, by derivation, illustration, etc., as to seem to amount to more than a *vocabulary*: as, a *Homeric dictionary*. A *glossary* is yet more restricted than a *vocabulary*, being a list and explanation of such terms in a work or author as are peculiar, as by being technical, dialectal, or antiquated: as, a *glossary* to Chaucer, Burns, etc.; a *glossary* of terms of art, philosophy, etc. *Lexicon* was originally and is often still confined to *dictionaries* of the Greek or Hebrew tongues, but it is also freely applied to a *dictionary* of any dead or merely foreign language: as, a German-English *lexicon*. A *nomenclature* is a complete list of the names or technical terms belonging to any one division or subdivision of science.—2. *Idiom*, *Diction*, etc. See *language*.

There are about 55 species, natives of Brazil, Guiana, eastern Peru, and the United States of Colombia. They are tall trees, or sometimes shrubs, often resinous, and with very handsomely netted-veined coriaceous leaves. The flowers are large, bright-orange or yellow, and odorless, forming elongated compound racemes or panicles; the leaves are decussate and opposite, or whorled. The wood is a valuable compact but not durable timber; that of *V. Guianensis* is known as *itaball-wood* and *copaibe-wood*. The flowers are singularly irregular: the posterior sepal is much larger than the other four, and usually spurred, and the petals are linear and spatulate, the anterior being much the larger. The flowers are bisexual, irregular, variously colored, often large, handsome, and odorless, and commonly racemose or panicle. They are remarkable in some of the genera for producing but a single petal, or but a single fertile stamen. The fruit is usually an oblong terete or three-angled capsule, with three coriaceous valves, often with winged pilose or cottony seeds, and large leaf-like corrugated cotyledons; in *Erisma*, a genus of trees of great size, the fruit is a very peculiar samara with long coriaceous falcate reticulated wings developed from calyx-segments.

E. vocal, vowel, vocable, advocate, avowson, avocation, vouch, avouch, convoke, evoke, invoke, provoke, revoke, equivocal, univocal, vocation, vociferate, etc.] 1. The sound uttered by the mouths of living creatures; especially, human utterance in speaking, singing, crying, shouting, etc.; the sound made by a person in speaking, singing, crying, etc.; the character, quality, or expression of the sounds so uttered: as, to hear a *voice*; to recognize a *voice*; a loud *voice*; a low *voice*.*

Shak., Lear, v. 3. 273.

Voice as a scientific term may mean either the faculty of uttering audible sounds, or the body of audible sounds produced by the organs of respiration, especially the larynx of man and other animals: contradistinguished from *speech* or *articulate language*. *Voice* is produced when air is driven by the muscles of expiration from the lungs through the trachea and strikes against the two vocal cords (see *cord*), the vibrations of which produce sounds varying in different animals according to the structure of the organs and the power which the animal possesses over them. *Voice* can, therefore, be found only in animals in which this system of respiration is developed, and the lungs and larynx (or syrinx) actually exist. Fishes, having no lungs, are dumb, as far as true vocal utterance is concerned, though various noises may issue from their throats (see *croaker, grunt, and drum*). In man the superior organization and mobility of the tongue and lips, as well as the perfection of the larynx, enable him to modify his vocal sounds to an almost infinite extent. In ordinary speaking the tones of the voice have nearly all the same pitch, and the variety of the sounds is due rather to the action of the mouth-organs than to definite movements of the glottis and vocal cords. In singing the successive sounds correspond more or less closely to the ideal tones of the musical scale. The male voice admits of division into tenor and bass, and the female into soprano and contralto. The lowest female tone is an octave or so higher than the lowest tone of the male voice; and the female's highest tone is about an octave above that of the male. The compass of both voices taken together is four octaves or more, the chief differences residing in the pitch and also in the timbre. In medicine, *voice* is the sound of utterance as transmitted through the lungs and chest-wall in auscultation. In zoology, *voice* is ordinarily restricted to respiratory sounds or vocal utterance, as above explained, and as distinguished from any mechanical noise, like stridulation, etc. The more usual word for the voice of any animal is *cry*; and the various cries, distinctive or characteristic of certain animals, take many distinctive terms, according to their vocal quality, as *bark, bay, bellow, bleat, bray, cackle, call, caw, chatter, chirp, chirrup, cluck, coo, croak, crow, gabble, gobble, groit, grunt, hiss, honk, hoot, howl, low, mew, neigh, peep, pipe, purr, quack, roak, scream, screech, snarl, snort, song, squall, squawk, squeak, squeal, trumpet, twitter, warble, wail, whine, whinny, whistle, whoop, yap, yell, yelp*, and many others. The voices of some animals, as certain monkeys and large carnivores and ruminants, may be heard a mile or more. The voice reaches its highest development, in animals other than human, in the distinctively musical class of birds, some of which, notably parrots and certain corvine and sturnoid birds, can be taught to talk intelligible speech.

The F. vide for vuide, however, has been influenced by association with the L. viduus. Another derivation, < LL. as if *voicitus for *vacitius, akin to vacare, be empty, vacuus, empty, vacuus, voicitus (see vacuus, vacant), rests on assumption. Cf. avoid, devoid.] I. *a.* 1. In strictness the word is appropriate only of that which is so utterly without effect that a person may act as if it did not exist; but a thing may be void as to some persons and not as to others. *Void* is, however, often used in place of *voidable*. *Voidable* is appropriate for that which a person has the right to make of no effect by application to court to have it adjudged *void*, or in some cases by notice or declaration, as a conveyance in fraud of creditors which is effectual between the parties, but may be avoided by a creditor, or a contract of an infant, which may be effectual until he has disaffirmed it. volcano (vol-kā'nō), *n.*; pl. *volcanoes, volcanos* (-nōz). [Formerly also *vulcano*; = *F. volcan* (> *Sp. volcan = Pg. vulcão, vulcão*), < *It. vulcano, also vulcano*, a burning mountain, prop. first applied to Mt. Etna, which was especially feigned to be the seat of Hephaestus (*Vulcan*), < *L. Vulcanus*, later *Vulcanus, Vulean*, the god of fire, also fig. fire; see *Vulcan*.] 1. A mountain or other elevation having at or near its apex an opening in the earth's crust from which heated materials are expelled either continuously or at regular or irregular intervals. These materials are molten rock (lava), ashes, cinders, large fragments of solid rock, mud, water, steam, and various gases. Such openings are ordinarily surrounded by more or less conical accumulations of the erupted materials, and it is to such cones that the term *volcano* is usually applied. The opening through which the lava rises is called the *vent* or *chimney*, and the cup-shaped enlargement of it, in its upper parts, the *crater*; there may be one such opening at the summit or on the flanks of the cone, or there may be a considerable number of them. In many volcanoes a central cone has upon its flanks a considerable number of minor cones (parasitic cones, as they are sometimes called). Etna has more than two hundred quite conspicuous cones within a radius of ten miles from the center of the main crater. The size and elevation of volcanoes vary greatly. The very high ones, like *Cotopaxi* and *Popocatepetl* and many others, are built up on high plateaus; others, like the extinct or dormant volcanoes of the Sierra Nevada of California, are chiefly made up of other than volcanic material, masked by the flow of eruptive matter down the slopes of a preexisting older mass. Volcanoes and volcanic regions vary greatly in the degree of their activity and in the length and frequency of their periods of repose; those volcanoes which during the historic period have shown no signs of activity are said to be extinct, or dormant if a long interval has elapsed since the last eruption. Nothing definite was known of the volcanic forces pent up within the area covered by *Vesuvius* prior to A. D. 79, when the great catastrophe took place by which *Pompeii* was overwhelmed, and which was briefly described by *Pliny the Younger* in his narrative of the death of his uncle, *Pliny the Elder*. Volcanoes and volcanic areas are very irregularly distributed over the earth, but are chiefly in the neighborhood of the ocean. The Asiatic and the American shores of the Pacific—not continuously, but in many places—are dotted with volcanoes, from Japan to the islands of the Indian Ocean, and from Patagonia to Alaska. The most active volcanic center in the world is the island of Java and its vicinity. This island, having about the area of England, contains forty-nine great volcanic cones, some of which are 12,000 feet in height. The eruption of *Krakatoa*, an island in the Sunda Strait, which took place in the closing days of August, 1883, was the most violent and destructive event of the kind of which history has any record. Nearly forty thousand persons were drowned along the coast adjacent to the Strait of Sunda by waves set in motion by the inrush of water to fill the cavity caused by the expulsion of material from the crater.

The act of willing; the exercise of the will. Volition does not consist in forming a choice or preference, but in an act of the soul in which the agent is generally held to have a peculiar sense of reaction.

The actual exercise of that power [the will], by directing any particular action or its forbearance, is . . . volition.

Locke, *Human Understanding*, II. xxi. 5.

Will is indeed an ambiguous word, being sometimes put for the faculty of willing, sometimes for the act of that faculty, besides other meanings. But volition always signifies the act of willing, and nothing else. Willingness, I think, is opposed to unwillingness or aversion. A man is willing to do what he has no aversion to do, or what he has some desire to do, though perhaps he has not the opportunity; and I think this is never called volition.

Reid, *Letter to Dr. J. Gregory* (Works, ed. Hamilton, p. 79).

An artist's brain receives and stores images often without distinct volition. T. Winthrop, *Cecil Dreeme*, xvii.

When a man's arm is raised in sequence to that state of consciousness we call a volition, the volition is not the immediate cause of the elevation of the arm.

There is no more miserable human being than one in whom nothing is habitual but indecision, and for whom the lighting of every cigar, the drinking of every cup, the time of rising and going to bed every day, and the beginning of every bit of work, are subjects of express volitional deliberation.

volumentometer (vol'ū-me-nom'e-tēr), *n.* [Irreg.
L. *volumen*, a volume, + Gr. *μέτρον*, measure.] An instrument for measuring the

measuring the volumes of gases, as a graduated
glass tube in which a gas may be collected over
water or mercury, the gas displacing the liquid
as it enters the vessel, and the volume displaced
being indicated by the graduations. Lunge's volu-
meter comprises a tube called a *reduction tube*, in which
a volume of one hundred cubic centimeters of air as measured
under connected pressure of barometer and temperature
is confined. By an ingenious arrangement this
confined air is then made to bring to a similar condition
of pressure the gas to be measured in a measuring-tube,
which also forms part of the apparatus. Thus a connection
of pressure and temperature need be made only once
for a series of volumetric measurements.

men*], volume, + Gr. *μετρικός*, *μέτρον*, measure.]

measurements by volume, as of gases or liquids;

that account; in the United States, especially during the civil war, a soldier of a body other than the regular army, but practically governed by the same laws when in service. In Great Britain the government provides the various bodies of volunteers, or citizen-soldiers, with competent instructors, arms, and a part of their ammunition, besides allowing to each corps certain grants proportioned to the number of efficient members, etc. A British volunteer can resign on giving a fortnight's notice, except in a crisis of imminent danger to the country. In the United States the army of volunteers comprises, to all intents and purposes—(1) the regular unpaid forces of State militia which, when called into the actual service of the United States, receive pay from the government, and are subject to the rules and articles of war, and (2) that class of troops which may from time to time be raised by Congress on occasions of national emergency. Such troops are properly United States troops, and the method of officering them is designated by Congress.

E. H. Knight.

Volutidæ (vô-lüt'i-tî-ê), *n. pl.* [NL., < *Voluta* + -idæ.] A family of rachioglossate gastropods, typified by the genus *Voluta*; the volutes. They have a large undivided foot, widely separate tentacles, eyes external to the tentacles, and a single (or triple) row of radular teeth, each median tooth generally having a trifurcate or simple apex. The operculum is generally absent; when present, as in *Volutolyria*, it is corneous and unguiculate, with apical nucleus in the adult. The animals are retractile in a shell generally of a more or less obconic shape, with a plicated columella. They are mostly ovoviviparous, but in the genus *Voluta* eggs are laid in a very large thin horny capsule. The species are numerous, especially in tropical seas, and many have shells of remarkable beauty, highly esteemed by conchologists. See *Voluta* (with cut) and *volute*, 2 (a) (with cut, and other cuts there cited).

It has a spherical cenobium of a pale-green color, which is constantly rotating and changing place, looking like a hollow globe, composed of numerous cells (sometimes as many as twelve thousand) arranged on the periphery at regular distances, and connected by the natrial gelatin. It is furnished with a red lateral spot, contractile vacuoles, and two long-exserted cilia. Propagation is both sexual and non-sexual. *V. globator*, the best-known species, is not uncommon in clear pools, ponds, etc. It was long regarded as an infusorial animalcule.

vomer (vô'mêr), *n.* [NL., < L. *vomer*, a plow-share.] 1. In *zool.* and *anat.*, a bone of the skull of most vertebrates; a membrane-bone or splint-bone developed in the median line of the skull, beneath the basicranial axis, primitively consisting of paired halves, which sometimes remain separate, one on each side of the middle line. Its special shapes and connections are extremely variable in the vertebrate series; in general, it is situated below or in advance of the basisphenoid, below or behind the mesethmoid, and between the maxillary, palatine, or pterygoid bones of opposite sides, serving thus as a septum between right and left nasal or nasopalatine passages. In man the vomer is plowshare-shaped, articulating with the sphenoid behind, the mesethmoid above, the palatal plates of the maxillary and palatal bones below, and the triangular median cartilage of the nose in front; it thus forms much of the nasal septum, or partition between right and left nasal cavities, its posterior free border definitely separating the posterior nares. In birds its extremely variable shapes and connections furnish valuable zoological characters. (See *egithognathous*, and cuts under *desmognathous*, *dromæognathous*, *sauræognathous*, and *schizognathous*.) The vomer is by Owen regarded as the centrum of the fourth or rhinencephalic

Volutes.—1. Greek Ionic: Temple of Artemis, Ephesus. 2. Composite (Roman): Baths of Caracalla, Rome.

Corinthian, and Composite capitals, of which it is a characteristic ornament. The number of volutes in the Greek Ionic capital is four, two each on opposite faces. In the Corinthian and Composite orders they are more numerous, in the former order being sixteen in number. See *helix*, 2 (with cut), and cuts under *Acanthus*, *Corinthian*, *Ionic*, and *composite*. Also *voluta*. 2. In *eouch.*: (a) A member of the *Volutidæ*. The volutes are chiefly tropical shells, especially of Indo-Pacific waters, some of them of great rarity and beauty, and highly prized by collectors, as *V. imperialis*, the imperial volute, which shows beautiful sculpture and tracery, and has a circlet of spines like a diadem crowning the very large body-whorl (see cut under *Voluta*). The peacock-tail volute, *Voluta* (or *Scaphella*) *junonia*, of quite another form, is white with orange spots, and was long considered one of the rarest of shells, bringing a very high price. Many of the volutes being well known, they take more distinctive names. Such is the West Indian music-shell, *Voluta musica*, so called because the markings resemble written music. This species, unlike most volutes, is operculate, and is placed by some authors in another genus, *Volutolyria* or *Musica*. Some volutes are known as *bat-shells*, as *V. vesper-tilio*; others as *yets* or *boat-shells* and *melon-shells* (see cuts under *Cymbium* and *Melo*); and some forms, as *Cymbium*, are oviparous. See also cut under *Volutidæ*. cranial vertebra—a view now entertained by few, it being generally regarded as a mere splint-bone. It is wanting in many vertebrates. The so-called vomer of fishes and batrachians is not homologically the bone of that name in higher vertebrates, but is identified by some with the parasphenoid (which see, with cut); while others name the ichthyoid vomer the *antial bone*. It often bears teeth. See cuts under *Chelonidæ*, *craniofacial*, *Cycloodus*, *Gallinæ*, *Lepidosiren*, *Ophidia*, *parasphenoid*, *Phyeter*, *Pythonidæ*, *Rana*, *teleost*, and *Thinocoridæ*.

The bones in Fish and Amphibians usually denominated *vomers* must part with their claims to that title and yield it to the so-called parasphenoid.

voodoo (vō-dō'), *n.* and *a.* [Also *voudou*; < creole F. *vaudou*, a negro sorcerer, prob. orig. a dial. form of F. *Vaudois*, a Waldensian (the Waldenses, as heretics, being accused of sorcery): see *Waldenses*. Cf. *hoodoo*.] **I.** *n.* 1. A common name among creoles and in many of the southern United States for any practitioner of malicious, defensive, amatory, healing, or soothsaying enchantments, charms, witchcrafts, or secret rites, especially when they are tinged with African superstitions and customs; especially, one who makes such practices a business.

The unprotected little widow should have had a very serious errand to bring her to the voodoo's house. G. W. Cable, Grandissimes, p. 90.

Every one has read of the noisy antics employed by the medicine-men among the Indians, and by the fetch-doctors and voodoo among the negroes, for driving diseases out of their patients. Pop. Sci. Mo., XXXIV. 803.

2. The same title transferred by voodooes to a personal evil spirit supreme among evil powers.

But for the small leaven of more intelligent whites, the black people would soon be victims of voodoo. Indeed, it is hard to find a rural community in the South where that dreadful bugbear is not more or less believed in and feared. Pop. Sci. Mo., XXVI. 44.

voodooism (vō-dō'izm), *n.* [Also *voudouism*; < *voodoo* + *-ism*.] The voodoo superstitions and practices. In the main these are only such fantastical

beliefs and impotent secret libations, burnings, etc., as are everywhere the recourse of base and puerile conditions of mind. There seems to be little in voodooism to justify the term "worship"; and still less does it seem to contain any group of beliefs, myths, or pious observances that make it in any sense a separate religion.

-vorous. [*L. vorus*, < *vorare*, devour: see voracious, vorant.] The terminal element, meaning 'eating,' of various compound adjectives, as *carnivorous*, *herbivorous*, *insectivorous*, *omnivorous*, *piscivorous*, etc.

vortex (vōr'teks), *n.*; pl. *vortices* or *vortexes* (vōr'ti-sēz, vōr'tek-sez). [= Sp. *vórtice* = Pg. *It. vortice*, < *L. vortex*, var. *verter*, a whirl, eddy, whirlpool, vortex: see *verter*, another form of the word.] 1. A whirl of fluid. An intuitive geometrical idea of the motion is not easily attained. If the motion of a fluid varies continuously both in time and in space, it may be described as such that each spherical particle is at each instant receiving three compressions or elongations at right angles to one another, and has, besides, a motion of translation and a motion of rotation about an axis through it. When this motion of rotation is present, the fluid is said to have a rotational motion; but this must not be confounded with a rotation of the whole mass. Thus, if all the parts of the fluid move in one direction but with unequal velocities in different parallel planes, though there be no rotation of the whole mass, yet the motion is rotational; and if a spherical particle were suddenly congealed, its inertia would make it rotate. On the other hand, one or more radial paddles turning about the axis of a cylindrical vessel filled with a perfect fluid, though making the latter revolve as a whole, could yet impart no rotational motion, which the fluid would evade by slipping round between the paddles. The motion being perfectly continuous, the axis of rotation of a particle must join the axis of rotation of a neighboring particle, so that a curve, called a *vortex-line*, may be described whose tangents are the axes of rotation of the particles at their points of tangency; and

such a curve must evidently return into itself or reach both extremities to the boundaries of the fluid. A vortex is a portion of fluid in rotational motion enclosed in an annular surface which is a locus of vortex-lines; and an infinitesimal vortex is called a *vortex-filament*. If at any part of a vortex-filament the angular velocity is greater than at another part a little removed along the vortex-line, then (considering a particle a little removed from the central vortex-line) it is plain that of two opposite parts of this particle having the same velocity in magnitude and direction and consequently on its axis of rotation, that one which is in the more rapidly moving stratum must be nearer the central vortex-line, so that the annular boundary of the vortex must present a constriction where the angular velocity is great; and thus it can be shown that the product of the mean angular velocity in any cross-section perpendicular to the vortex-lines multiplied by the area of that section is constant at all parts of the vortex. In a perfect fluid, which can sustain no distorting stress even for an instant, the velocity of a rotating particle cannot be retarded any more than if it were a frictionless sphere; and, in like manner, no such velocity can be increased. Consequently, a vortex, unlike a wave, continues to be composed of the same identical matter. When the motion is continuous throughout the fluid, two vortices exercise a singular action upon one another, each ring in turn contracting and passing through the aperture of the other, which stretches, with other singular motions.

2. Any whirling or gyratory motion; also, a whirlpool.

He soon found himself absorbed in the same vortex of worldly passions and interests from which he had been so anxious to escape. *Prescott, Ferd. and Isa., ii. 5.*

3. In the Cartesian philosophy, a collection of material particles, forming a fluid or ether, endowed with a rapid rotatory motion about an axis, and filling all space, by which Descartes accounted for the motions of the universe. This theory attracted much attention at one time, but is now entirely discredited.—3. [*cap.*] [NL.] In *zool.*, the typical genus of *Vorticidae*, containing such species as *V. viridis*.—**Electrolytic vortices**, currents circulating round closed paths in the liquid or liquid and plate, but not passing through the external circuit, in an electrolytic cell.—**Vortex of the heart**, the peculiar spiral concentration of the fibers at the apex, produced by the twisting of the external fibers as they pass back to join those of the inner layer. Also called *whorl of the heart*.—**Vortex-ring**, in physics, a vortical molecular filament or column returning into itself so as to form a ring composed of a number of small rotating circles placed side by side, like beads on a string, as the singular smoke-rings which are sometimes produced when a cannon is fired, or when a smoker skilfully emits a puff of tobacco-smoke. Recent labors in the theoretical investigation of the motion of vortices, more particularly the theorems relating to vortex-filaments rotating round a central axis in a frictionless or perfect fluid (vortex-atoms), have suggested the possibility of founding on them a new form of the atomic theory.—**Vortex theory**, the theory that atoms of ordinary matter are vortices in a fluid. The object of the hypothesis seems to be to explain away action at a distance—a proceeding hardly in harmony with the theory of energy.—**Vortices lentis**, star-like figures seen on the surface of the crystalline lens of the eye.

Many species are colonial inhabitants of both salt and fresh water; they are very numerous, and among the most elegant animalcules, like tiny transparent wine-glasses or bells borne on fine elastic stems, and continually waving about in the most graceful manner, "as if they were ringing chimes for Indians to dance." *V. cornularia* was described by Leewenhook in 1675 as an "animalcule of the first size," and called by Linnaeus *Hydra con-*

These animalcules are campanulate, ovate, or subcylindrical, with eccentric terminal mouth having a spiral fringe of adoral cilia, the right limb of which descends into the mouth, while the left wreathes about a movable ciliate disk; they rarely if ever have trichocysts, but usually a long, slender vestibular seta. The family is one of the largest and most easily recognizable among infusorians, the oral structures being very characteristic. The little creatures inhabit both salt and fresh water. Some are naked, constituting the *Vorticellinae*; others live in hard (*Vaginicolinae*) or soft (*Ophrydiinae*) lorice or investing sheaths. There are several genera and numerous species. vow-breach (von'brech), *n.* The breaking of a vow.

vowel (vou'el), *n.* and *a.* [Formerly also *rowell*; *<* F. *voyelle* = Sp. Pg. *vocal* = It. *vocale*, a vowel, *<* L. *vocalis*, a vowel, fem. (sc. *littera*, letter) of *vocalis*, sounding, sonorous, *<* *vox* (*roc-*), voice, sound: see *voice*, *vocal*.] **I. n.** 1. One of the openest, most resonant, and continuable sounds uttered by the voice in the process of speaking; a sound in which the element of tone, though modified and differentiated by positions of the mouth-organs, is predominant; a tone-sound, as distinguished from a friative (in which a rustling between closely approximated organs is the predominant element), from a mute (in which the explosion of a closure is characteristic), and so on. *Vowel* and *consonant* are relative terms, distinguishing respectively the opener and closer utterances; but there is no absolute division between them. Certain sounds are so open as to be only vowels; certain others so close as to be only consonants; but there are yet others which have the value now of vowels and now of consonants. Thus, *l* and *n* have frequently vowel-value in English, as in *apple*, *token*; and *r* is in various languages a much used vowel. Also, the semivowels *y* and *w* are not appreciably different from the *v*-vowel (of *pieque*) and the *u*-vowel (of *rule*) respectively. A sound, namely, is a vowel if it forms the central or open element of a syllable, being a syllable either alone or in conjunction with the closer sounds (consonants) that accompany it (See *syllable*.) The openest of the vowels is *a* (as in *far*, *father*); the

closest are *i* and *u* (in *pieque*, *rule*); and these three, with *e* and *o* (as in *they*, *tone*), intermediate respectively between *a* and *i* and *a* and *u*, are hardly wanting in any known human language. But many others are found in various languages, and their number is theoretically unlimited.

VOX (voks), *n.* [L.: see *voice*.] Voice; in music, a voice or voice-part.—**Vox angelica**, in *organ-building*, a stop having two pipes to each digital, one of which is tuned slightly sharp, so that by their dissonance a wavy effect is produced. The pipes are of narrow scale, and the tone is delicate. Also *vox celestis*, *unda maris*, etc.—**Vox antecedens**, the theme or antecedent of a canon or fugue.—**Vox barbara**, a barbarous or outlandish word or phrase: commonly used, in zoology and botany, of those terms which are ostensibly New Latin, but which are neither Latin nor Greek, nor of classic derivation and formation, or are hybrids between Latin and Greek. Some thousands of such words are current, though rejected by some purists; and their use is far less objectionable than the unending confusion in nomenclature which attends the attempt to discard them. (See *synonym*, 2 (b).) Usually abbreviated *vox barb.*—**Vox celestis**. Same as *vox angelica*.—**Vox consequens**, the answer or consequent of a canon or fugue.—**Vox humana**, in *organ-building*, a reed-stop having short capped pipes, so constructed as to reinforce the higher harmonics of the fundamental tones, and thus to produce tones more or less resembling those of the human voice. The imitation is not close, but under suitable conditions the illusion of a distant singer or choir is possible. The tremulant is usually combined with the *vox humana*. A stop of the same name, but of much less effectiveness, is often placed in reed-organs.—**Vox quinta**. Same as *quintus*.

These men were nearly always French Canadians or half-breeds.

In *Rom. myth.*, the god of fire and the working of metals, and the patron of all handicraftsmen. Originally an independent deity, he became with the advance of time completely identified with the Greek Hephaestus. He was the son of Jupiter and Juno, or of Juno alone, and was born with deformed feet, though according to late myths his lameness came from his having been hurled down from heaven by Jupiter in a fit of anger. He was the divine artist, the creator of all that was beautiful as well as of all that was mechanically wonderful in the abodes of the gods. On earth various volcanoes, as Lemnos and Etna, were held to be his workshops, and the Cyclopes were his journeymen. He had the power of conferring life upon his creations, and was thus the author of Pandora and of the golden dogs of Alcinoia. In art he was represented as a bearded man, usually with the short sleeveless or one-sleeved tunic (exomis) of the workman, with a conical cap, holding hammer and tongs or other attributes of the smith, and sometimes with indication of his lameness. When Jupiter conceived Minerva in his head, the goddess was delivered full-armed, upon the stroke of an ax in the hands of Vulcan.

2. A hypothetical planet between the sun and the planet Mercury. An object supposed to be a planet was seen crossing the sun's disk on March 26th, 1859. The period of revolution assigned to it was something over 19 days, and its distance from the sun was estimated at about 13,000,000 miles. The existence of Vulcan, however, has not been confirmed (may, indeed, be said to have been practically disproved) by subsequent careful observations.

vulcanisable, vulcanisation, etc. See *vulcanizable*, etc.

vulcanism (vul'kan-izm), *n.* [< *Vulcan* + *-ism*.] In *geol.*, same as *volcanism*. The words *volcano* and *vulcanic* are firmly fixed in English, and the former is in universal and exclusive use among those who speak that language. Hence all the derivatives should be spelled correspondingly: thus, *volcanism*, *vulcanicity*, *volcanology*, and not *vulcanism*, etc.

In the lapse of ages . . . the very roots of former volcanoes have been laid bare, displaying subterranean phases of *vulcanism* which could not be studied in any modern volcano. Encyc. Brit., X. 240.

Vulcanist (vul'kan-ist), *n.* [< *Vulcan* + *-ist*.] In the early history of geological science, one who supported the Huttonian theory, or who was in opposition to the views of Werner. See *Huttonian*.

It is sufficient to remark that these systems are usually reduced to two classes, according as they refer the origin of terrestrial bodies to fire or water; and that, conformably to this division, their followers have of late been distinguished by the fanciful names of *Vulcanists* and *Nepturnists*. To the former of these Dr. Hutton belongs much more than to the latter; though, as he employs the agency both of fire and water in his system, he cannot, in strict propriety, be arranged with either.

Playfair, Illustrations of the Huttonian Theory (Coll. Works, I. 21).

vulcanite (vul'kan-it), *n.* [< *Vulcan* + *-ite*.] 1. The harder of the two forms of vulcanized india-rubber, the other form being known as *soft rubber*. Vulcanite differs from soft rubber in that it contains more sulphur, and is cured or vulcanized at a higher temperature. It is of a brownish-black color, is hard and tough, cuts easily, and takes a good polish; it is largely used for making into combs, brooches, bracelets, and many other ornaments. It is not affected by water or by any of the other caustic solvents. As it is especially distinguished by the large quantity of electricity which it evolves when rubbed, it is much used in the construction of electric machines. Also called *ebonite*.

2. A name sometimes given to pyroxene, from its being found in ejected blocks and lavas.—**Vulcanite flask**, an iron box closed by screw-bolts, for holding an artificial denture while being vulcanized, to fix the artificial teeth in the vulcanite plate. The flask is heated in a vulcanizing furnace.

vulcanizable (vul'kan-i-za-bl), *a.* [< *vulcanize* + *-able*.] Capable of being vulcanized; admitting of vulcanization. Also spelled *vulcanisable*.

vulcanization (vul'kan-i-zá'shon), *n.* [< *vulcanize* + *-ation*.] A method of treating caoutchouc or india-rubber with some form of sulphur, to effect certain changes in its properties, and yield a soft (vulcanized india-rubber) or a hard (vulcanite) product. This was originally effected by dipping the rubber in melted sulphur and heating it to nearly 300°. Several other methods have been employed, probably the best of which for general purposes consists in mechanically mixing the rubber at a moderate heat with fowers of sulphur, and subsequently "curing" it in superheated steam at from 250° to 300° Fahr. The process was invented by Charles Goodyear, who obtained his first patent for it in 1844. Other ingredients, as litharge, white lead, zinc-white, whiting, etc. are added to the sulphur to give color, softness, etc. to the rubber. The substance thus formed possesses the following properties: it remains elastic at all temperatures; it cannot be dissolved by the ordinary solvents, neither is it affected by heat within a considerable range of temperature; finally, it acquires extraordinary powers of resisting compression, with a great increase of strength and elasticity. Vulcanized india-rubber is employed with great success for very many useful purposes, as for water-proofing cloth, for boots, shoes, mats, toys, belting, buffers, wheel-tires, for hoots, shoes, mats, pipes, fire-hose, medical and surgical appliances, etc. Hard vulcanized rubber is known as

ebonite or *vulcanite*. See *vulcanite*. Also spelled *vulcanisation*.

vulcanize (vul'kan-íz), *v.*; pref. and pp. *vulcanized*, ppr. *vulcanizing*. [= F. *vulcaniser*; as *Vulcan* (with allusion to the melted sulphur of volcanoes) + *-ize*.] I. *trans.* To subject to the process of vulcanization, as caoutchouc.—**Vulcanized fiber**. See *fiber*¹.—**Vulcanized glass**, glass cooled by plunging into a bath having a comparatively high temperature. The nature of the bath depends upon the effect desired to be produced.—**Vulcanized rubber**, caoutchouc incorporated with sulphur and subjected to heat, whereby it combines chemically with the sulphur, and assumes, when cold, a hard consistency resembling that of horn.

2. [*cap.*] Of or pertaining to the Vulgate, or old Latin version of the Scriptures.

II. n. [*cap.*] 1. The Latin version of the Scriptures accepted as the authorized version of the Roman Catholic Church. It was prepared by Jerome about the close of the fourth century, partly by translation from the original, partly by revision of prior Latin versions. The Vulgate gradually came into general use between the sixth and the ninth century. The Anglo-Saxon translations were made from it and Wyclif's English version, while other English versions from Tyndale's onward have been much influenced by it. The Vulgate was the first book printed (about 1455). The Council of Trent ordered that the "old and vulgate edition," approved by the "usage of so many ages," should be the only Latin version used in "public lectures, disputations, sermons, and expositions." Authorized editions were afterward published under Sixtus V. in 1590 and Clement VIII. in 1592-3. The latter, or Clementine edition, is the present accepted standard of the Roman Catholic Church, and is the basis of the Douay Bible. The religious terminology of the languages of western Europe has been in great part derived from or influenced by the Vulgate.

All the vulpine quadrupeds have been placed in this genus, which, however, is now restricted by the exclusion of such forms as *Urocyon* (the gray foxes of America), *Otocyon* or *Megalotis* of Africa, and *Nyctereutes* of Japan. Even with these restrictions there are numerous species, of Europe, Asia, Africa, and North America (none in South America), closely related to the common fox; as well as the more different types represented by the African fennec (*Vulpes fennecus zerda*), the Asiatic corsac (*V. corsac*), the North American kit (*V. velox*), and the circum-polar isatis, or arctic fox (*V. lagopus*). But the group is not sharply delimited from *Caninæ*, as the South American fox-wolves (see *Pseudalopex*) and some African forms (see *Thomomys*) connect the two. thers, the beak and claws less powerful than in most birds of prey, and which feed largely or wholly upon carrion. They for the most part inhabit warm countries. Birds of this description are found both in the Old World and in the New; and, misled by superficial appearances and general habits, naturalists have applied the name to members of different suborders. (a) The Old World vultures, which, in spite of their peculiar outward aspect, are so little different from ordinary hawks and eagles that they can at most be considered as a subfamily *Vulturinæ* of the family *Falconidae*. Of these there are several genera and numerous species, inhabiting the warmer parts of Europe, Asia, and Africa, where they act as efficient scavengers to clear the earth of offal and carcasses, which would otherwise become offensive. The cinereous or brown vulture, *Vultur monachus* or *V. cinereus*, is a typical example; it inhabits all countries bordering the Mediterranean, and extends thence to India and China. The griffin-vultures are species of *Gyps*. The Bengal vulture, inhabiting India, is *Pseudogyps bengalensis*. Related species are the Angola vulture, *Gypohierax angolensis* (see cut under *Gypohierax*), the immense *Otogyps auricularis*, of Africa (see *Otogyps*), and *Lophogyps occipitalis*. The Egyptian vulture, quite unlike any of the foregoing, is *Neophron percnopterus*, often called *Pharaoh's hen* (see cut under *Neophron*). The bearded vulture of the Alps, etc., or the lammergeier, *Gypaetus barbatus*, has the head feathered, and does not hesitate to attack living animals; this is the connecting-link between vultures and hawks or eagles, being sometimes placed in *Vulturinæ*, sometimes in *Falconinæ*. (See cut under *Gypaetus*.) (b) The American vultures of the suborder *Cathartidae*. The species of this group with which the name *vulture* is specifically connected are the urubū, or black vulture, *Catharista atrata*; the turkey-buzzard or turkey-vulture, *Cathartes aura*; and the king-vulture, *Sarcorhamphus papa*: the condor usually keeps its own distinctive name. See *Cathartidae*, and cuts under *condor*, *king-vulture*, *turkey-buzzard*, and *urubū*.

vulture-raven (vul'tūr-rā'vn), *n.* A book-name of the thick-billed African ravens, of the genus *Corvultur*, *C. albicollis* and *C. crassirostris*. They are noted for the stoutness and especially the depth of the bill, resulting from the strong convexity of the high-arched culmen, like that of a bird of prey. *C. albicollis* is 18 inches long, with the bill 3 inches along the culmen; the plumage is glossy-black, with concealed white on the neck; the beak is dark-brown, with the tips of the mandibles whitish; the feet are brownish-black, the irides hazel-brown. This species is South African. *C. crassirostris*, of northeastern Africa, is larger, being 2 feet long, with the beak nearly 4 inches. The former species was originally described by Latham as the *South Sea raven*, and later by Levaillant as the *corbebeau* (whence the generic name *Corvultur* imposed by Lesson in 1831); another synonym is *Corvus vulturinus*.

Head of Vulture-raven (*Corvultur albicollis*), reduced.

Vulturidae (vul-tū'ri-dē), *n. pl.* [NL., < L. *vultur*, a vulture (see *vulture*), + *-idae*.] A family of birds, artificially composed of the birds popularly called *vultures* in both hemispheres. There are no good characters to distinguish the Old World vultures from the family *Falconidae*, of which they may at most form a subfamily *Vulturinæ*, while, on the other hand, there are strong characters separating the American vultures from all others. The family has in consequence been nearly abandoned by ornithologists, or at least restricted to the Old World vultures. See *vulture*.

Vulturinæ (vul-tū'ri-nē), *n. pl.* [NL., < *Vultur* + *-inæ*.] A subfamily of *Falconidae*, confined to the Old World, and consisting of the vultures of Europe, Asia, and Africa, characterized chiefly by their naked heads and carrion-feeding habits. See *vulture*.

When adult it is black, more or less extensively white on the back, rump, and upper tail-coverts;

The earthy particles mingled with the ore entering above fall against a current of water rising from beneath, the velocity of which is regulated so that a more or less complete separation of the ore from the gangue is effected. These boxes are generally arranged in a series of four or more, and there are many varieties of the apparatus, of which the general principle was the invention of Von Rittinger, an Austrian metallurgist. This method has proved to be of great value in ore-dressing. Also called *pointed box*, *pyramidal box*, and *spitzkasten*.

1. The twenty-third letter and eighteenth consonant-sign in the English alphabet. It has a double value, as consonant and as vowel. As an alphabetic character it is of very modern date, being one of the four that have sprung from the F or F added by the Greeks to the older Phœnician alphabet, and one of the three (U, V, W) that have grown out of the Roman form of that character (see U). It was made (as pointed out under U) by doubling the U- or F-sign (hence called *double U*), in order to distinguish properly the semivowel sound *w* from the spirant *v* and the vowel *u*. It was formerly often printed as two V's, *VV*, *ve*. It began to be used in the eleventh century, and gradually crowded out the special sign for the same sound which the Anglo-Saxon alphabet had possessed. The alphabetic sound distinctively represented by *w* is the labial semivowel, which stands in precisely the same relation to *oo* (o) in which consonantal *y* stands to *ee* (ē). Each of these semivowels, if not of precisely the same mode of production with the corresponding vowel, is at any rate only very slightly different from it; *w* is virtually an *oo* which is abbreviated into a mere prefix to another vowel, a close position from which the organs by opening reach another vowel-sound; and a prolonged *w* is an *oo*. On the other hand, the semivowel *v* (like the semivowel *y*) can be only very imperfectly and indistinctly uttered after a vowel, and our *w* in that position is but another way of writing *v*; it is found only in the combinations *aw*, *ev*, *ow*, which are equivalent to *au*, *eu*, *ou*; and as so long it could disappear from the language without any loss, but rather with profit. The semivowel sound *w* (including *wh* and *qu*, which is a way of writing *kw*: see under Q) is a not uncommon element of English utterance, being about 2½ per cent. of it (a little less than the spirant *v*). In many languages—for example, in all those that are descended from the Latin—the semivowel *w* tends to pass over into the spirant *v*-sound, and hence the spirant value of our *v*, which was the representative in Latin of the *w*-sound. In Anglo-Saxon a *w* stood and was pronounced also before *r* (and in a few words before *l*); in such words as *write*, *wring*, the character is retained, though the sound is lost. In Anglo-Saxon, also, the *w* was in many words pronounced with a preceding aspiration, the relic of an original prefixed guttural mute, and it was consistently and properly so written: for example, *hwit*, white, *hwær*, where. In modern English the *h* has by an odd and unaccountable caprice had its place in writing changed to after the *w* (perhaps by analogy with the similar blunder shown in writing *rh* in Latin for the Greek aspirated *r*, or *hr*, or by a blind conformity with the frequent initial digraphs *th*, *ph*, *sh*). There is dispute among phonetists at present as to the true character of this *wh*-sound, some maintaining that it is not a *w* with preceding aspiration, but a *urd* counterpart to *v*, standing related to it as, for example, an *f* to a *r*, or an *s* to a *z*. This view rests in part, probably, on some actual difference of utterance, but in part also on unfamiliarity with the real *wh*; for in England the aspiration is now very generally omitted, and *wh*, *when*, *white*, etc., are pronounced as *wen*, *when*, etc. It admits of no question, however, that *when*, for example, is related to *hoo-en* precisely as *wen* to *oo-en*, the difference in each case consisting in an aspiration prefixed respectively to the vowel and semivowel—just as, correspondingly, *hew* (which shows an *h* prefixed to the English "long u" sound, or *yoo*) is related to *hoo-oo* precisely as *uce* to *oo-oo*: the *h* being here, as everywhere else (see H), uttered through the same position of the mouth-organs as the following sound. If it is sometimes silent, not only as initial before *r* (see above), but elsewhere, as in *two*, *sword*, *answer*, etc. It is never doubled. The assimilating influence of a *w* (whether written with *v* or with *u* in the combination *qu*) in a following *a*-sound is very marked, giving the *a* in many words the short sound of *o* (o), as in *what*, *squad*, etc., or the broad sound of *a* (ā), as in *war*, *quart*, *thwart*, etc.

II. *intrans.* 1. To contend; battle. [Rare.]

I abjure all rooſs, and choise To *wage* against the enmity o' the air, To be a comrade with the wolf and owl. Shak., Lear, ii. 4. 212.

2. To serve as a pledge or stake for something else; be opposed as equal stakes in a wager; be equal in value: followed by *with*. [Rare.] The commodity *wages* not *with* the danger. Shak., Pericles, iv. 2. 34.

wagedom (wāj'dum), n. [*ME. wage* + *-dom*.] The method of paying wages for work done. [Rare.] The employer of labour pockets the whole of the increment of value, leaving to the labourers only what they had to start with—viz., their own bodies, plus the cost of their maintenance during the process, and a small allowance for wear and tear. . . . Such is the modern system of *wagedom*. Westminster Rev., CXXVI. 136.

wage-earner (wāj'ēr'nēr), n. One who receives stated wages for labor. Radical manufacturers and tradcers . . . have no more thought for the condition of the *wage-earners* who produce this profit than a Southern planter had for the religious welfare of his gang of slaves. Nineteenth Century, XXVI. 733.

wage-fund, wages-fund (wāj'fund, wā'jez-fund), n. In *polit. econ.*, that part of the total productive capital of a country or community which is employed in paying the wages of labor, as distinguished from the part invested in buildings, machinery, raw materials, etc. See the quotations. Wages, then, depend mainly upon the demand and supply of labour, or, as it is often expressed, on the proportion between population and capital. By population is here meant the number only of the labouring class, or rather of those who work for hire; and by capital only circulating capital, and not even the whole of that, but the part which is expended in the direct purchase of labour. To this, however, must be added all funds which, without forming a part of capital, are paid in exchange for labour, such as the wages of soldiers, domestic servants, and all other unproductive labourers. There is unfortunately no mode of expressing by one familiar term the aggregate of what may be called the *wages-fund* of a country; and, as the wages of productive labour form nearly the whole of that fund, it is usual to overlook the smaller and less important part, and to say that wages depend on population and capital. It will be convenient to employ this expression, remembering, however, to consider it as elliptical, and not as a literal statement of the entire truth. J. S. Mill, Pol. Econ., II. xi. 1.

As I understand this passage [from Mill's "Pol. Econ.,"] it embraces the following statements: 1st, *Wages-fund* is a general term, used, in the absence of any other more familiar, to express the aggregate of all wages at any given time in possession of the laboring population; 2nd, on the proportion of this fund to the number of the laboring population depends at any given time the average rate of wages; 3rd, the amount of the fund is determined by the amount of the general wealth which is applied to the direct purchase of labor, whether with a view to productive or to unproductive employment. If the reader will carefully consider these several propositions, I think he will perceive that they do not contain matter which can be properly regarded as open to dispute. The first is little more than a definition. . . . The second merely amounts to saying that the quotient will be such as the dividend and divisor determine. The third equally contains an indisputable assertion; since, whatever be the remote causes on which the wages of hired labor depend, . . . the proximate act determining their aggregate amount must in all cases be a direct purchase of its services. In truth, the demand for labor, thus understood, as measured by the amount of wealth applied to the direct purchase of labor, might more correctly be said to be, than to determine, the *Wages-fund*. It is the *Wages-fund* in its inchoate stage, differing from it only as wealth just about to pass into the hands of laborers differs from the same wealth when it has got into their hands. J. E. Cairns, Some Leading Principles of Political Economy Newly Expounded, II. i. § 5.
